Section 1—General Information

Introduction

PowerPacT™ M-, P-, and R-frame and ComPacT™ NS630b–NS3200 electronic trip molded case circuit breakers are designed to protect electrical systems from damage caused by overloads, short circuits, and ground faults. All circuit breakers are designed to open and close a circuit by nonautomatic means and to open the circuit automatically on a predetermined overcurrent. Electronic trip molded case circuit breakers use an electronic trip system to signal the circuit breaker to open automatically.

The PowerPacT M-frame (800 A frame size), P-frame (1200 A frame size) and R-frame (3000 A frame size) circuit breakers are dual rated to UL489 and IEC 60947-2. The ComPacT NS630b–NS1600 (1600 A frame size) and NS1600b–NS3200 (3200 A frame) circuit breakers are rated to IEC 60947-2 only.

M-frame molded case circuit breakers are equipped with a basic electronic trip system, which is available in an adjustable amperage trip unit capable of 300–800 A settings, or a fixed amperage device capable rated at 400 or 600 A. P-frame, R-frame and NS630b–NS3200 molded case circuit breakers are available with either a basic ET 1.0I electronic trip system or with a more advanced MicroLogic™ trip system. Electronic trip motor circuit protectors (trip system ET 1.0M), which trip on short circuit only, and automatic molded case switches, which trip at a predetermined self-protection level only, are also available for special applications. All of these circuit breakers are available labeled as Square D™ or Schneider Electric™.

For information on other Square D brand PowerPacT molded case circuit breakers, see the Class 611 catalog: *PowerPacT H-, J-, and L-Frame Circuit Breakers*.

Features and Benefits

M-frame, P-frame, R-frame and NS630b–NS3200 electronic trip circuit breakers:

- Provide overload and short-circuit protection
- Are true RMS sensing devices
- Provide means to manually disconnect power to the circuit
- Provide enhanced coordination by their adjustability
- Provide high interrupting ratings and withstand ratings

Circuit breakers with MicroLogic trip units can also:

- Provide integral equipment ground-fault protection or alarm
- Provide communications
- Provide power monitoring
- Provide protective relaying functions
- Provide zone-selective interlocking (ZSI), which can reduce damage in the event of a fault

Specifications

Electronic trip molded case circuit breakers have a molded case made of a glass-reinforced insulating material (thermal set composite resin) that provides high dielectric strength. These circuit breakers:

- Are available in either dual-rated Underwriters Laboratory® (UL®) / International Electrotechnical Commission® (IEC®) or IEC-only constructions
- Are also Canadian Standard Association® (CSA®) and Association of the Electrical Sector® (ANCE®) certified (dual-rated UL/IEC circuit breakers only)
- Are manufactured in unit-mount, I-Line™ and drawout (P-frame and NS630b–NS1600) constructions
- Are available with either type ET or MicroLogic electronic tripping systems
- Provide optional power monitoring, communications, protective relaying, integral ground-fault protection for equipment and zone-selective interlocking functions
- Share common tripping of all poles
- Can be mounted and operated in any position¹
- Are equipped with an externally-accessible test port for use with hand-held and full-function test sets
- Are available in motor circuit protector and automatic molded case switch constructions
- Can be reverse connected, without restrictive LINE and LOAD markings
- Meet the requirements of National Electrical Code® (NEC®) Sections 240.6 by providing a means to seal the rating plug and trip unit adjustments

Codes and Standards

M-, P- and R-frame, and NS630b–NS3200 electronic trip circuit breakers and switches are manufactured and tested in accordance with the following standards:

Standards

M-Frame, P-Frame and R-Frame Circuit Breakers	P- and R-Frame Switches	NS630b–NS3200 Circuit Breakers	NS630b–NS3200 Switches
UL 489 ² IEC Standard 60947-2 CSA C22.2 No 5 Federal Specification W-C-375B/GEN NEMA AB1 NMX J-266 UTE, VDE, BS, CEI, UNE, CCC	UL 489 ³ IEC Standard 60947-3 CSA C22.2 No 5 Federal Specification W-C-375B/GEN NEMA AB1 NMX J-266 UTE, VDE, BS, CEI, UNE	IEC Standard 60947-2 Federal Specification W-C-375B/GEN NEMA AB1 UTE, VDE, BS, CEI, UNE	IEC Standard 60947-3 Federal Specification W-C-375B/GEN NEMA AB1 UTE, VDE, BS, CEI, UNE

Circuit breakers should be applied according to guidelines detailed in the NEC and other local wiring codes.

1. ComPacT NW circuit breakers are not available with I-Line terminations. (They cannot be mounted horizontally, only vertically.)
2. PowerPacT M-frame circuit breaker is in UL File E10027.
PowerPacT P-frame circuit breaker is in UL File E63335.
PowerPacT R-frame circuit breaker is in UL File E10027.
3. PowerPacT P-frame switch is in UL File E103740.
PowerPacT R-frame switch is in UL File E33117.

Circuit Breaker Ratings

Interrupting Rating

The interrupting rating is the highest current at rated voltage the circuit breaker is designed to interrupt under standard test conditions. Circuit breakers must be selected with interrupting ratings equal to or greater than the available short-circuit current at the point where the circuit breaker is applied to the system (unless it is a branch device in a series rated combination). Interrupting ratings are shown on the front of the circuit breaker. For grounded B phase interrupting ratings, see Data Bulletin 2700DB0202.

4. The K interrupting rating is recommended for applications having high inrush and/or non-linear loads such as large motors, transformers, motors with soft starts, etc.

Application Ratings

The voltage rating is the highest voltage for the electrical system on which the circuit breaker can be applied. The frequency rating indicates the system frequency for which the circuit breaker is intended. The withstand rating is used to improve system coordination by maximizing the current level at which the circuit breaker trips with no intentional delay. The withstand rating is the level of RMS symmetrical current that a circuit breaker can carry in a closed position for a stated period of time.

Voltage, Frequency and Withstand Ratings

Circuit Breaker	Voltage Rating	Frequency Rating	Withstand Rating at 480 Vac ⁵
MG, MJ	600 Vac	60 Hz (UL), 50/60 Hz (IEC)	10 kA (0.5 sec)
PG, PK	600 Vac	60 Hz (UL), 50/60 Hz (IEC)	25 kA (0.5 sec)
PJ	600 Vac	60 Hz (UL), 50/60 Hz (IEC)	10 kA (0.5 sec)
PL	480 Vac	60 Hz (UL), 50/60 Hz (IEC)	10 kA (0.5 sec)
R-frame (RG, RJ, RK, RL)	600 Vac	60 Hz (UL), 50/60 Hz (IEC)	32 kA (3 sec)
NS630b–NS1600 N Interrupting Rating	690 Vac	50/60 Hz (IEC)	19.2 kA (1 sec)
NS630b–NS1600 H Interrupting Rating	690 Vac	50/60 Hz (IEC)	19.2 kA (1 sec)
NS630b–NS1000 L Interrupting Rating	690 Vac	50/60 Hz (IEC)	N/A
NS630b–NS1000 R Interrupting Rating	690 Vac	50/60 Hz (IEC)	N/A
NS1600b–NS3200 N Interrupting Rating	690 Vac	50/60 Hz (IEC)	32 kA (3 sec)
NS1600b–NS3200 H Interrupting Rating	440 Vac	50/60 Hz (IEC)	32 kA (3 sec)

Ampere Rating (Continuous Current Rating)

The ampere rating (or continuous current rating) (I_r) is the maximum current that a circuit breaker can carry. The sensor size (I_n) is the maximum ampere rating for a specific circuit breaker and is based on the size of the sensor plug inside the circuit breaker. This value is printed below the trip unit on the sensor plug. See *Sensor Plugs*, page 142 for more information.

NOTE: The maximum ampere rating a circuit breaker family can carry is called the frame size. Sensor size is less than or equal to frame size.

The ampere rating of a type ET electronic trip circuit breaker is equal to the current sensor size (I_n).

The ampere rating of a MicroLogic electronic trip circuit breaker is determined by the mathematical equation:

Ampere Rating = Sensor Size x Rating Plug Setting ($I_r = I_n \times \text{Rating Plug Setting}$)

The rating plug varies the circuit breaker ampere rating as a function of its sensor size. Rating plugs have nine dial settings; the multiplier values corresponding with each setting are printed on the rating plug.

The maximum setting range is 0.4–1.0 x I_n .

5. A system coordination study should be done for optimum circuit breaker coordination.

Enclosure Sizes

All type ET electronic trip UL/IEC M-frame, P-frame and R-frame circuit breakers are available as standard rated circuit breakers. MicroLogic electronic trip UL/IEC circuit breakers are also available in 100% rated constructions. Because the additional heat generated when applying circuit breakers at 100% of continuous current rating, the use of specially designed enclosures and 194°F (90°C) rated wire sized per the 167°F (75°C) NEC chart is required.

Circuit breakers with 100% rating can also be used in applications requiring only 80% continuous loading.

Minimum Enclosure Sizes for Fixed-Mounted Circuit Breakers

Circuit Breaker Rating	Enclosure Dimensions (h x w x d)		Ventilation Area	
	3P Circuit Breaker	4P Circuit Breaker	Top	Bottom
M-Frame, ≤ 800 A, Standard Rated	51.9 x 20.25 x 7.75 in. (1318.3 x 514.4 x 196.9 mm)	51.9 x 23.01 x 7.75 in. (1318.3 x 584.4 x 196.9 mm)	—	—
P-Frame, ≤ 800 A, 100% Rated P-Frame, ≤ 1200 A, Standard Rated	51.9 x 20.25 x 7.75 in. (1318.3 x 514.4 x 196.9 mm)	51.9 x 23.01 x 7.75 in. (1318.3 x 584.4 x 196.9 mm)	—	—
P-Frame, ≤ 1200 A, 100% Rated	62.25 x 23 x 14.75 in. (1581.2 x 584.2 x 374.7 mm)	62.25 x 25.76 x 14.75 in. (1581.2 x 654.2 x 374.7 mm)	16.5 in. (10.645 mm)	16.5 in. (10.645 mm)
R-Frame, Standard Rated ⁶	30 x 21 x 7 in. (762 x 533 x 178 mm)	30 x 25.5 x 7 in. (762 x 648 x 178 mm)	—	—
R-Frame, 100% Rated ⁶	30 x 21 x 7 in. (762 x 533 x 178 mm)	30 x 25.5 x 7 in. (762 x 648 x 178 mm)	40.25 in. (26.000 mm)	40.25 in. (26.000 mm)

Operating Conditions

Temperature

To meet the requirements of the UL489 Standard, molded case circuit breakers are designed, built and calibrated for use on 50/60 Hz ac systems in a 104°F (40°C) ambient environment. Electronic trip circuit breakers, however, are designed to react only to the magnitude of the current flowing through the circuit breaker and are inherently ambient insensitive. Both UL/IEC and IEC-only circuit breakers may be operated at temperatures between -13°F and +158°F (-25°C and +70°C). For temperatures other than 104°F (40°C), the circuit breakers must be re-rated as shown.

Temperature Re-rating Values

Maximum Ambient Temperature													
°F	158	140	122	104	86	77	68	50	32	14	-4	13	-22
°C	70	60	50	40	30	25	20	10	0	-10	-20	-25	-25
Current	0.75	0.83	0.92	1.00	1.07	1.11	1.14	1.21	1.27	1.33	1.39	1.42	1.44

6. RLTB or RL3TB kits may extend beyond end of enclosure when using minimum enclosure size.

Altitude

Circuit breakers are suitable for use at altitudes up to 13,100 ft. (4000 m). For altitudes higher than 6560 ft. (2000 m), circuit breakers must be derated as shown.

Altitude Derating Values Per ANSI C37.20.1 Table 10

Altitude	≤ 6,600 ft. (≤ 2,000 m)	8,500 ft. (2,600 m)	13,000 ft. (3,900 m)
Voltage	1.00	0.95	0.80
Current	1.00	0.99	0.96

Extreme Atmospheric Conditions

PowerPacT circuit breakers have successfully passed the tests defined below for extreme atmospheric conditions.

Dry cold and dry heat:

- IEC 68-2-1—Dry cold at -67°F (-55°C)
- IEC 68-2-2—Dry heat at 185°F (+85°C)

Damp heat (tropicalization)

- IEC 68-2-30—Damp heat (temperature 131°F (55°C) and relative humidity of 95%, condensing)
- IEC 68-2-52 level 2—Salt mist

The materials used in the PowerPacT circuit breakers will not support the growth of fungus and mold.

Vibration

PowerPacT circuit breakers meet IEC 60068-2-6 Standards for vibration.

- 2 to 13.2 Hz and amplitude 0.039 in. (1 mm)
- 13.2 to 100 Hz constant acceleration

Storage Temperature

Circuit breakers with trip units without LCD displays may be stored in the original packaging at temperatures between -58°F (-50°C) and +185°F (+85°C).

For circuit breakers with trip units with LCD displays, this range is -40°F (-40°C) to +185°F (+85°C).

Trip System

ET
Electronic
Trip Unit

MicroLogic
Electronic
Trip Unit

The trip system causes the circuit breaker to open automatically under overload, short-circuit or equipment ground-fault conditions. Electronic trip circuit breakers give the customer more versatility to achieve coordination with features such as adjustable instantaneous pickup and high withstand ratings.

The type ET and the MicroLogic trip systems consist of current sensors, a microprocessor-based trip unit, and a tripping coil. The tripping coil is a flux transfer solenoid that requires no external power source. All type ET and MicroLogic protective functions are completely fault powered.

MicroLogic Trip System

Features found in MicroLogic electronic trip circuit breakers, such as universally interchangeable rating plugs, adjustable long-time pickups and 100% ratings also provide capacity for future growth.

The integral equipment ground-fault sensing capabilities available with MicroLogic trip systems mean that there are fewer parts and pieces to purchase, mount and wire. These capabilities include integral ground-fault protection for equipment, which causes the circuit breaker to trip when a ground fault is detected, as well as integral ground-fault alarm, which does not trip the circuit breaker but sends an alarm when a ground fault is detected.

Certain MicroLogic trip systems also offer the customer true power management system solutions through communication. These trip units can communicate with other circuit breakers in the system and also with a power monitoring system. Communication is by Modbus™ and does not require proprietary software.

Communication between trip units allows zone-selective interlocking (ZSI) between circuit breakers at different levels in the system. ZSI reduces fault stress by allowing the upstream circuit breaker closest to the fault to ignore its preset delay time and trip without any intentional delay on a short circuit or ground fault. For more information on ZSI, see data bulletin *Reducing Fault Stress with Zone-Selective Interlocking*.

Communication with a power monitoring system through a communications network allows a ground fault to be reported without interrupting power to the system. It also allows the power monitoring system to remotely report power usage, current flow, and trip history.

Instantaneous OFF Feature

MicroLogic 5.0 and 6.0 Standard, A, P, and H electronic trip units provide the unique ability to turn the instantaneous tripping function OFF. Turning off the instantaneous trip function increases the current level at which the circuit breaker will trip with no intentional delay to the level of the short-time withstand rating. This current level is typically much higher than any of the pickup levels provided by the adjustable instantaneous feature. Therefore, using the instantaneous OFF feature improves coordination by allowing the user to take advantage of the circuit breaker withstand rating.

Motor Circuit Protectors

An instantaneous trip version of the electronic trip circuit breaker is also available for motor circuit protection. These motor circuit protectors comply with NEC requirements for providing short-circuit protection when installed as part of a Listed combination controller having motor overload protection.

Electronic trip motor circuit protectors are similar in construction to type ET electronic trip circuit breakers. They are designed as disconnect devices for use in combination with motor starters. These motor circuit protectors provide short-circuit protection only and have an adjustable amperage pickup so they can be set to open instantaneously at current values slightly above the motor starting inrush current. This setting coordinates the pickup time-current response of the motor circuit protector with the overload relay of the motor starter to give the best possible protection.

Current interrupting ratings for these UL Recognized components are established in combination with motor starters and properly-sized overload relays and contactors.

Automatic Molded Case Switches

The M-, P- and R-frame circuit breakers are also available in automatic molded case switch construction. Automatic switches are similar in construction to electronic trip circuit breakers, except that the switches open instantaneously at a factory-set non-adjustable trip point calibrated to protect only the molded case switch itself. Because of their molded case construction, they are more compact than conventional disconnect switches and accept electrical accessories for added flexibility.

Molded case switches are intended for use as disconnect devices only. UL489 requires molded case switches to be protected by a circuit breaker or fuse of equivalent rating. Molded case switches are labeled with their appropriate withstand ratings. The withstand rating of a switch is defined as the maximum current at rated voltage that the molded case switch will withstand without damage when protected by a circuit breaker with an equal continuous current rating.

P- and R-Frame Withstand Ratings

Voltage	Withstand Rating ⁷								
	M-Frame Circuit Breakers			P-Frame Circuit Breakers			R-Frame Circuit Breakers		
	J	K	L	J	K	L	J	K	L
240 Vac	100 V	—	—	100 kA	65 kA	125 kA	—	65 kA	125 kA
480 Vac	65 V	—	—	65 kA	50 kA	100 kA	—	50 kA	100 kA
600 Vac	23 V	—	—	25 kA	50 kA	25 kA	—	50 kA	50 kA

7. The withstand rating is the fault current at rated voltage that the molded case switch will withstand without damage when protected by a circuit breaker with an equal continuous current rating.

Internal Operating Mechanism

Manually-Operated Circuit Breakers

M-frame, P-frame, R-frame and NS630b–NS3200 manually-operated circuit breakers have a single operating handle that acts directly through the operating mechanism against the contact blades. Multi-pole circuit breakers have a common trip bar for positive action of all poles on manual and automatic operation. These circuit breakers have a trip-free mechanism that allows them to trip even though the operating handle may be restricted (by a handle operating mechanism or padlock attachment) in the I/ON position. If not restricted, the operating handle moves to a position between I/ON and O/OFF when the circuit breaker is tripped.

The face of the manually-operated circuit breaker is marked with standard ON/OFF and international I/O markings to indicate handle position. In addition, the O/OFF portion of the circuit breaker handle is color coded green.

Electrically-Operated Circuit Breakers

P-frame and NS630b–NS1600 circuit breakers are also available with a two-step stored-energy mechanism which can be charged manually or using a motor. The closing time is less than five cycles. Closing and opening operations can be initiated by remote control or by push buttons on the front cover. An O-C-O (open-close-open) cycle is possible without recharging. Electrically-operated circuit breakers include a motor, shunt trip, and shunt close of the same voltage plus an overcurrent trip switch (SDE).

The face of electrically-operated circuit breakers is also marked ON/OFF and I/O, and equipped with a position indicator to show contact position.

Push-to-Trip Button

The push-to-trip button located on the face of each manually-operated circuit breaker is a standard feature on these circuit breakers. This allows the user to manually trip the circuit breaker without risking exposure to live parts. During normal on-off operation, the handle opens and closes the circuit breaker contact but does not exercise the tripping mechanism.

Use the push-to-trip button to:

- Exercise the circuit breaker mechanism
- Check the auxiliary and alarm switch circuits

Circuit Breaker Mounting and Connections

Circuit Breaker Mounting and Connections

Circuit Breaker	Unit-Mount Construction		I-Line Construction	Drawout Construction
	Cable Connection	Bus Connection		
M-Frame	X	X	X	—
P-Frame	X	X	X	X
R-Frame	X ⁸	X	X ⁹	—
NS630b–NS1250	X	X	—	X
NS1600–NS3200	—	X	—	—

Unit-Mount Circuit Breakers

Unit-mount M-frame, P-frame, R-frame and NS630b–NS3200 circuit breakers are individually-mounted using supplied mounting screws. The four mounting screws are inserted through mounting holes molded into the circuit breaker case and threaded into the circuit breaker mounting enclosure. To properly support the circuit breaker, all four mounting screws must be used.

Unit-mount M-frame, P-frame and NS630b–NS1250 circuit breakers can be ordered with mechanical line and load side lugs. The standard lugs can be removed for the installation of compression-type lugs or bus connections. All lugs are UL Listed for their proper application and marked for use with aluminum and copper (Al/Cu) or copper only (Cu) conductors. Lugs suitable for copper and aluminum conductors are made of tin-plated aluminum. Lugs suitable for use with copper conductors only are made of copper.

See individual frame sections for frame-specific connection information.

M-Frame Unit-Mount

P-Frame Unit-Mount

Electrically Operated P-Frame Unit-Mount

R-Frame Unit-Mount

8. Must use RLTB or RL3TB terminal pad kit.
 9. Through 1200 A, 100% rated only.

I-Line Circuit Breakers

M-frame circuit breakers through 800 A and P-frame and R-frame circuit breakers through 1200 A are available in I-Line construction for easy installation and removal in I-Line panelboards and switchboards. I-Line circuit breakers use “blow-on” type line side connectors. In case of a short circuit, increased magnetic flux causes the plug-on connectors of the circuit breaker to tighten their grasp on the panelboard or switchboard bus bars. The I-Line connectors and circuit breaker mounting bracket are integral parts of I-Line circuit breakers and cannot be removed or replaced. I-Line circuit breakers come with mechanical load side lugs.

M-Frame I-Line

P-Frame I-Line

R-Frame I-Line

Drawout Circuit Breakers

P-Frame Drawout
Circuit Breaker

P-frame manually-operated circuit breakers and switches are also available in drawout construction. The drawout assembly mechanism allows the circuit breaker to be racked in four positions (connected, test, disconnect or withdrawn).

P-frame cradles are ordered separately and are available with factory and field-installed accessories. See Section 10 —P-Frame Cradles and Cradle Accessories, page 158 for details.

Catalog Numbering System

The M-frame, P-frame, R-frame and NS630b–NS3200 circuit breakers and cradles follow a “smart” catalog numbering system. The following tables are intended as a tool to decipher existing catalog numbers. **They are not intended for use in building catalog numbers, as some combinations may not be available.** To build a catalog number, please see the *Digest*, the *Product Selector* or contact the local field office.

M-Frame, P-Frame and R-Frame Circuit Breaker Catalog Numbers

NOTE: Not all options are available on all frames.

Catalog Number for M-, P- and R-Frame (UL/IEC Dual-Rated) Circuit Breakers

Field Position	Field Description	Options	Description
1	Brand Name	(blank)	Square D

11–18	Miscellaneous Cradle Options	X	See Product Selector.

Testing Requirements

UL, NEMA, CSA, and NMX requirements

The UL, NEMA, CSA and NMX labels on a circuit breaker indicate that the circuit breaker meets the requirements of UL Standard 489, NEMA Standard AB-1, CSA Standard C22.2 No. 5 and NMX standard J266. The labels also mean that the production procedure is monitored by UL, CSA and ANCE inspectors to ensure continued compliance to these standards. These requirements include the following tests:

- **200% Overload Calibration**—each pole of the circuit breaker must trip within a specified time limit when carrying 200% of its continuous current rating.
- **135% Overload Calibration**—with all poles connected in series, the circuit breaker must trip within a specified time limit while carrying 135% of its continuous current rating.
- **Overload**—the circuit breaker must make and break 600% of its continuous current rating at rated voltage. Circuit breaker frame sizes 125–1600 A must perform 50 operations at 600%. Circuit breaker frame sizes 2000–2500 A must perform 25 operations at 600%.
- **Temperature Rise**—while carrying 100% of rated current and mounted in open air, temperature rise on a wiring terminal must be within specified limits. For 100% rating, the circuit breaker is mounted in an enclosure.
- **Endurance**—UL489 requires that the circuit breaker must complete, at minimum, the following number of operations:

Endurance Operations

Frame Size	Operations	
	With Current ¹³	Without Current
1200–2500	500	2000

- **Calibration**—both the 200% and 135% overload calibration tests are repeated after endurance testing.
- **Short Circuit**—the circuit breaker shall be subjected to test currents based on voltage rating and frame size, with the type and number of operations based on the number of poles, frame rating and voltage rating. Example: a 3P, 600 Vac, 2500 A frame circuit breaker is subjected to one 20 kA single-phase closing of the circuit on the circuit breaker per pole and one 30 kA three-phase closing of the circuit on the circuit breaker for a total of seven short circuit tests.
- **Trip Out**—the 200% thermal calibration test is repeated following the short-circuit tests.
- **Dielectric**—the circuit breaker must withstand, for one minute, twice its rated voltage plus 1000 V:
 - Between line and load terminals with the circuit breaker in the open, tripped and OFF positions.
 - Between terminals of opposite polarity with the circuit breaker closed.
 - Between live parts and the overall enclosure with the circuit breaker both open and closed.

No conditioning of the circuit breaker can take place during or between tests. There can be no failure of functional parts at the conclusion of the sequences.

After qualifying a set of circuit breakers to the standard tests, a manufacturer can have additional circuit breaker samples tested on higher than standard available fault currents. The following performance requirements apply:

- **200% Overload Calibration**—each pole of the circuit breaker must trip within a specified time limit when carrying 200% of its continuous current rating.

13. UL requires the circuit breaker to operate 10% of the “with current” operations with a shunt trip.

- *Short-Circuit Test*—with the load side terminals connected by 10-inch lengths of specified cable (or a shorting bar), the circuit breaker is exposed to a short-circuit current for a set time interval. After safe interruption, the circuit breaker is reset and closed again on the short circuit.
- *250% Overload Calibration*—each pole of the circuit breaker must trip within a specified time limit when carrying 250% of its continuous current rating.
- *Dielectric Withstand*—the circuit breaker is subjected to twice the voltage rating at which the interrupting test was conducted, but not less than 900 V.
 - Between line and load terminals with the circuit breaker in the tripped and in the OFF positions.
 - Between terminals of opposite polarity with the circuit breaker closed.
 - Between live parts and the overall enclosure with the circuit breaker both open and closed.

When the sample circuit breakers pass these tests, circuit breakers of the same construction can be marked or labeled with the current interrupting rating for the higher fault currents.

IEC Requirements

The IEC markings on a circuit breaker indicates that the circuit breaker meets the requirements of IEC Standard 60947-2 for circuit breakers and 60947-3 for automatic switches. These requirements include the following tests:

IEC Test Sequence

Sequence	Category of Devices	Tests
General Performance Characteristics (Sequence 1)	All Circuit Breakers	<ul style="list-style-type: none"> • Tripping Limits and Characteristics • Dielectric Properties • Mechanical and Electrical Endurance • Overload • Dielectric Voltage Withstand • Temperature Rise • 145% Calibration (3 poles in series or 3-phase test)

Section 2—Energy Management

Energy Management Using the Smart System

Use the Smart System to connect your building to real savings in three steps:

1. Measure
 - Embedded and stand-alone metering and control
2. Connect
 - Integrated communication interfaces
 - Ready to connect to energy management platforms
3. Save
 - Data-driven energy efficiency actions
 - Real-time monitoring and control
 - Access to energy and site information through on-line services

Measure

Smart System communications mean visible information.

Grouping most of the electrical protection, command and metering components, the switchboards are now significant sources of data locally displayed and sent via communication networks.

Connect

Smart Systems use reliable, simple-to-install-and-use displays, and Ethernet and Modbus interfaces.

Information is safely transmitted through the most efficient networks:

- Modbus SL inside switchboards, between components,
- Ethernet, on cable or WiFi, inside the building and connecting switchboards and computers,
- Ethernet or GPRS, for access to on-line services by Schneider Electric.

Energy experts, no matter where they are located, can now provide advise based on the updated data of the building.

Save

On-Site Real-Time Monitoring and Control

The FDM128 touch screen display connected to the Ethernet:

- shows essential electrical information and alarms concerning the electrical network,
- allows control (open, close, reset...) of various equipment.

The FDM128 touch screen provides real-time value checking and control, directly on the front panel of the main switchboard.

On a PC display with common browser:

- shows monitoring web pages hosted into the local Ethernet interface,
- alarm events generate automatic email notifications,
- allows control (open, close, reset...) of various equipment.

The data is displayed graphically or recorded into files for optimizing the use of energy in the building.

As an example, the data can help validate the change of temperature settings, time scheduling in a Building Management System or other automated devices.

On-Line Energy Management Services

StruXureWare Energy Operation automates data collection using an open, scalable, and secure energy management information system.

With the help of the Schneider Electric energy management services team, data is turned into information to enable customers to understand their facilities' performance on an ongoing basis.

Energy Operation leverages companies' current investments in their existing systems, and can be used to communicate advanced results and performance to a broad audience for a shared understanding throughout an organization.

Power Meter Functions

In addition to protection functions, MicroLogic A/P/H trip units offer all the functions of Power Meter products as well as operating assistance for the circuit breaker.

MicroLogic A/P/H trip unit measurement functions are made possible by the MicroLogic trip unit's intelligence and the accuracy of the sensors. They are handled by a microprocessor that operates independent of protection functions.

Display Function

Display Function

FDM121 Display Unit (One to One)

The FDM121 switchboard display unit can be connected to a communication (COM) option (Breaker Communication Module [BCM ULP]) using a circuit breaker ULP cord to display all measurements on a screen. The LCD screen is 3.78 x 3.78 in. (96 x 96 mm). The FMD121 display unit requires a 24 Vdc power supply. The COM option (BCM ULP) unit is supplied by the same power supply via the circuit breaker ULP cord connecting it to the FDM121. See FDM121 Display, page 35 for more information.

FDM121 Display Navigation

FDM121 Display Current

FDM121 Display Voltage

FDM121 Display Power

FDM121 Display Consumption

FDM128 Display Unit (One to Eight)

The FDM128 display unit uses an IFE Ethernet interface for low-voltage circuit breakers.

FDM128 Display Navigation

FDM128 Display Current

FDM128 Display Voltage

FDM128 Display Power

FDM128 Display Consumption

For all FDM, in addition to the information displayed on the MicroLogic trip unit LCD, the FDM screen shows demand, power quality, and maximum/minimum ammeter values along with histories and maintenance indicators.

Measurement Function

Instantaneous RMS Measurements

Measurement Function

The MicroLogic trip unit continuously displays the RMS value of the highest current of the three phases and neutral (I_{max}). The navigation buttons can be used to scroll through the main measurements.

In the event of a fault trip, the trip cause is displayed.

The MicroLogic A trip unit measures phase, neutral, and ground fault currents.

MicroLogic P/H trip units offer voltage, power, power factor, frequency, and $\cos \phi$ in addition to the measurements provided by MicroLogic A trip units.

Maximum/Minimum Ammeter

Every instantaneous measurement provided by MicroLogic A trip units can be associated with a maximum/minimum ammeter. The maximum for the highest current of the three phases, neutral, and demand current can be reset using the FDM display unit or the communication system.

Energy Metering

The MicroLogic P/H trip units also measures the energy consumed since the last reset of the meter. The active energy meter can be reset using the MicroLogic trip unit keypad, the FDM display unit, or the communication system.

Demand and Maximum Demand Values

MicroLogic P/H trip units also calculate demand current and power values. These calculations can be made using a block or sliding interval that can be set from five to sixty minutes in steps of one minute. The window can be synchronised with a signal sent through the communication system. Whatever the calculation method, the calculated values can be recovered on a PC through the communication network.

Ordinary spreadsheet software can be used to provide trend curves and forecasts based on this data. They provide a basis for load shedding and reconnection operations used to adjust consumption to the subscribed power.

Power Quality

The MicroLogic H trip unit calculates power quality indicators taking into account the presence of harmonics up to the fifteenth harmonic, including the total harmonic distortion (THD) of current and voltage.

MicroLogic A/P/H Trip Units Integrated Power Meter Functions (Continued)

MicroLogic A/P/H Integrated Power Meter Functions			Type	Display	
				MicroLogic LCD	FDM Display
Demand Power	Active (kWh), reactive (kVAR), apparent (kVA)	Present value on the selected window Maximum demand since last reset	P/H P/H	X X	X X
Calculation Window	Sliding, fixed or com-synchronised	Adjustable from 5 to 60 minutes in 1 minute steps ¹⁵	P/H	—	—
Power Quality					
Total Harmonic Distortion (%)	Of voltage with respect to rms value	THDU, THDV of the Ph-Ph and Ph-N voltage	H	X	X
	Of current with respect to rms value	THDI of the phase current	H	X	X

15. Available via the communication system only.

Histories

- Trip indications in clear text in a number of user-selectable languages
- Time-stamping: date and time of trip.

Maintenance Indicators

MicroLogic trip units have indicators for, among other items, the number of operating cycles, load profile, and operating times (operating hours counter).

It is possible to assign an alarm to the operating cycle counter to plan maintenance.

The various indicators can be used together with the trip histories to analyze the level of stresses the device has been subjected to.

Contact Wear

Contact wear algorithms only function on MasterPacT circuit breakers, and contact wear cannot be selected for PowerPacT or ComPacT circuit breakers.

Each time a MasterPacT circuit breaker opens, the MicroLogic P/H trip unit measures the interrupted current and increments the contact-wear indicator as a function of the interrupted current, according to test results stored in memory. Breaking under normal load conditions results in a very slight increment. The indicator value may be read on the FDM display.

It provides an estimation of contact wear calculated on the basis of the cumulative forces affecting the circuit breaker. When the indicator reaches 100%, it is advised to visually inspect the contacts per the instructions in the circuit breaker user guide.

Circuit Breaker Load Profile

MicroLogic A/P/H trip units calculate the load profile of the circuit breaker protecting a load circuit. The profile indicates the percentage of the total operating time at four current levels (% of circuit breaker I_n):

- 0 to 49% I_n
- 50 to 79% I_n
- 80 to 89% I_n
- $\geq 90\%$ I_n .

This information can be used to optimize use of the protected equipment or to plan ahead for maintenance interval extensions.

Management of Installed Devices

Each circuit breaker equipped with a COM option (BCM ULP) can be identified using the communication system:

- serial number
- firmware version
- hardware version
- device name assigned by the user.

This information together with the previously described indications provides a clear description of the installed devices.

MicroLogic A/P/H Trip Units Operating Assistance Functions

MicroLogic A/P/H Operating Assistance Functions			Type	Display	
				MicroLogic LCD	FDM Display

Counter	Mechanical cycles	Assignable to an alarm	A/P/H	—	X
	Electrical cycles	Assignable to an alarm	A/P/H	—	X
	Hours	Total operating time (hours) ¹⁶	A/P/H	—	—
Indicator	Contact wear	%	P/H	X	X
Load Profile	Hours at different load levels	% of hours in four current ranges: 0-49% In, 50-79% In, 80-89% In and ≥ 90% In	P/H	—	X

16. Available through the communication system only.

FDM121 Display

MicroLogic trip unit measurement capabilities come into full play with the FDM121 display. It connects to the COM option (BCM ULP) with a circuit breaker ULP cord and displays the MicroLogic trip unit information. The result is a true integrated unit combining a circuit breaker and a power meter. Additional operating assistance functions can also be displayed.

An FDM121 display unit can be connected to ULP communication devices using a prefabricated cord to display all measurements, alarms, histories and event tables, maintenance indicators, and management of installed devices on a screen.

The FMD121 display unit requires a 24 Vdc power supply.

The FDM121 is a display that can be integrated with the PowerPacT H/J/L/P/R or MasterPacT NW/NT circuit breaker systems. It uses the sensors and processing capacity of the MicroLogic trip unit. It is easy to use and requires no special software or settings. It is immediately operational when connected to the circuit breaker by a ULP cord.

It also provides monitoring and control with the use of the I/O application module, the motor mechanism module, or the circuit breaker communication module (BCM ULP).

The FDM121 has a large display, but requires very little depth. The anti-glare graphic screen is backlit for easy reading even under poor ambient lighting and at sharp angles.

FDM121 Display of MicroLogic Trip Unit Measurements and Alarms

The FDM121 is intended to display MicroLogic trip unit measurements, alarms and operating information. It cannot be used to modify the protection settings.

Measurements can be easily accessed using a menu. All user-defined alarms are automatically displayed. The display mode depends on the priority level selected during alarm set-up:

- high priority: a pop-up window displays the time-stamped description of the alarm and the orange Alarm LED flashes;
- medium priority: the orange Alarm LED goes continuously on;
- low priority: no display on the screen.

All faults resulting in a trip automatically produce a high-priority alarm, without any special settings required. In all cases, the alarm history is updated. The MicroLogic trip unit saves the information in its non-volatile memory in the event of an FDM121 power loss.

FDM121 Status Indications and Remote Control

FDM121 Display

Surface Mount Accessory

When the circuit breaker is equipped with the Breaker Communications Module (BCM ULP), the FDM121 display can also be used to view circuit breaker status conditions:

- O/F: ON/OFF
- SD: trip indication
- SDE: fault-trip indication (overload, short-circuit, or ground fault).

When the circuit breaker system is equipped with the I/O application module, the FDM121 can monitor and control:

- cradle management
- circuit breaker operation
- light and load control
- custom applications.

When the circuit breaker is equipped with the COM option (BCM ULP) (including connection to shunt close [XF] and shunt trip [MX1] communication voltage releases), the FDM121 display can also be used to control (open/close) the circuit breaker.

Two operating mode are available:

- local mode: open/close commands are enabled from the FDM121 while disabled from the communication network;
- remote mode: open/close commands are disabled from the FDM121 while enabled from the communication network.

FDM121 Main Characteristics

Connection with FDM121 Display Unit

- A 3.78 x 3.78 x 1.18 in. (96 x 96 x 30 mm) screen requiring 0.39 in. (10 mm) behind the door (or 0.79 in. [20 mm] when the 24 V power supply connector is used).
- White backlighting.
- Wide viewing angle: vertical $\pm 60^\circ$, horizontal $\pm 30^\circ$.
- High resolution: excellent reading of graphic symbols.
- Alarm LED: flashing orange for alarm pick-up, steady orange after operator reset if the alarm condition persists.
- Operating temperature range: $+14^\circ\text{F}$ (-10°C) to $+131^\circ\text{F}$ ($+55^\circ\text{C}$).
- CE / UL / CSA marking.
- 24 Vdc power supply, with tolerances 24 V -20% (19.2 V) to 24 V +10% (26.4 V).

When the FDM121 is connected to the communication network, the 24 Vdc can be supplied by the communication system wiring system. Consumption is 40 mA.

FDM121 Mounting

The FDM121 is easily installed in a switchboard.

- Standard door cut-out is 3.6 x 3.6 in. (92 x 92 mm).
- Attached using clips.

To avoid a cut-out in the door, an accessory is available for surface mounting by drilling only two 0.87 in. (22 mm) diameter holes.

FDM121 Connection

The FDM121 is equipped with a 24 Vdc terminal block:

- A plug-in type terminal block with two wire inputs per point for easy daisy-chaining.
- A power supply range of 24 Vdc -20% (19.2 V) to 24 Vdc +10% (26.4 V).
- A 24 Vdc type auxiliary power supply must be connected to a single point on the ULP system. The FDM121 display has a two-point screw connector on the rear panel of the module for this purpose. The ULP module to which the auxiliary power supply is connected distributes the supply via the ULP cable to all the ULP modules connected to the system and therefore also to MicroLogic trip unit. See wiring diagram later in this section.
- Two RJ45 jacks.

The MicroLogic trip unit connects to the internal communication terminal block on the PowerPacT or ComPacT circuit breaker with the circuit breaker ULP cord. Connection to one of the RJ45 connectors on the FDM121 automatically establishes communication between the MicroLogic trip unit and the FDM121 and supplies power to the MicroLogic trip unit measurement functions.

When the second connector is not used, it must be fitted with a line terminator.

FDM121 Navigation

Five buttons are used for intuitive and fast navigation.

The “Context” button may be used to select the type of display (digital, bar graph, analogue).

The user can select the display language (Chinese, English, French, German, Italian, Portuguese, Spanish, etc.).

Product Identification

Metering: Submenu

Metering: Meter

Services

Screens

Main Menu

When powered up, the FDM121 screen automatically displays the ON/OFF status of the device.

Quick View

Metering

Control

Alarms

Services

When not in use, the screen is not backlit. Backlighting can be activated by pressing one of the buttons. It goes off after three minutes.

Fast Access to Essential Information

- “Quick view” provides access to five screens that display a summary of essential operating information (I, U-V, f, P, E, THD, circuit breaker ON/OFF).

Access to Detailed Information

- “Metering” can be used to display the measurement data (I, U-V, f, P, Q, S, E, THD, PF) with the corresponding min/max values.
- “Alarms” displays active alarms and the alarm history.
- “Services” provides access to the operation counters, energy and maximum ammeter reset function, maintenance indicators, identification of modules connected to the internal bus, and FDM121 internal settings (language, contrast, etc.).

Communication Components and FDM121 Connections

The FDM121 degree of protection is IP54 in front. IP54 is maintained after switchboard mounting by using the supplied gasket during installation.

FDM121 Connections

Circuit Breaker ULP Cord

Connections

PowerPacT and ComPacT circuit breakers are connected to the ULP devices (FDM121 display, IFM, IFE or I/O unit) via the circuit breaker ULP cord.

Cord is available in three lengths: 0.98 ft. (0.35 m), 4.3 ft. (1.3 m) and 9.8 ft. (3 m).

Lengths up to 32.9 ft. (10 m) are possible using extensions.

- A. Modbus Network
- B. Ethernet Network
- C. Circuit Breaker ULP Cord
- D. FDM Display
- E. ULP Termination
- F. ULP Cable

FDM128 Display

The MicroLogic trip unit measurement capabilities are fully utilized with the FDM128 display. The FDM128 display connects to Ethernet communication using the RJ45 port and displays MicroLogic trip unit information. The result is an integrated unit combining a circuit breaker with a power meter. Additional operating assistance functions can also be displayed.

The FDM128 display unit can be connected to a MicroLogic COM option (BCM ULP through an IFE). It uses the sensors and processing capacity of the MicroLogic trip unit and requires no special software or settings. The FDM128 is a large display, but requires very little depth. The anti-glare graphic screen is backlit for easy reading even under poor ambient lighting and at sharp angles.

The FDM128 display is designed to manage up to eight devices (PowerPacT H/J/L/P/R or MasterPacT NW/NT circuit breakers).

FDM128 Display of MicroLogic Trip Unit Measurements and Trips

The FDM128 is intended to display MicroLogic A/P/H trip unit measurements, trips, and operating information. It cannot be used to modify the protection settings.

- Measurements may be easily accessed using a menu.
- Trips are automatically displayed.
- A pop-up window displays the time-stamped description of the trip.

FDM128 Status Indications

When the circuit breaker is equipped with the COM option (BCM ULP) (including its set of sensors) the FDM128 display can also be used to view circuit breaker status conditions:

- O/F: ON/OFF
- SDE: Fault-trip indication (overload, short-circuit, ground fault)
- PF: ready to close
- CH: charged (spring loaded).
- CE, CD, CT cradle management with I/O application module.

FDM128 Remote Control

When the circuit breaker is equipped with the COM option (BCM ULP) (including connection to shunt close [XF] and shunt trip [MX1] communication voltage releases), the FDM128 display can also be used to operate (open/close) the circuit breaker.

Two operating mode are available:

- Local mode: open/close commands are enabled from the FDM128 while disabled from the communication network.
- Remote mode: open/close commands are disabled from the FDM128 while enabled from the communication network.

FDM128 Main Characteristics

FDM128 Display

- 4.54 x 3.40 in. (115.2 x 86.4 mm) with 5.7 in. (145 mm) QVGA display 320 x 240 pixels.
- Color TFT LCD, with LED backlight.
- Wide viewing angle: vertical $\pm 80^\circ$, horizontal $\pm 70^\circ$.
- High resolution: excellent reading of graphic symbols.
- Operating temperature range: +14°F (-10°C) to +131°F (+55°C).
- CE / UL / CSA marking.
- 24 Vdc power supply, -10%/+20% (limit 20.4–28.8 Vdc).
- Consumption 6.8 W.

FDM128 Mounting

Surface Mount Accessory

The FDM128 is easily installed in a switchboard.

- Standard door hole is \varnothing 0.87 in. (22 mm).
- The FDM128 degree of protection is IP65 at the touch screen cover. IP54 is maintained after installation by using the supplied gasket.

FDM128 Connection

Connection with Display Unit

The FDM128 is equipped with:

- A 24 Vdc terminal block:
 - The terminal block has a power supply range of 24 Vdc (limit 20.4–28.8 Vdc).
 - The FDM128 display unit has a 2-point screw connector on the rear panel of the module for the terminal block.
- One RJ45 Ethernet jack.

The MicroLogic trip unit connects to the internal communication terminal block on the MasterPacT circuit breakers through the circuit breaker ULP cord and Ethernet connection through the IFE.

FDM128 Navigation

A touch screen is used for intuitive and fast navigation.

The user can select the display language (Chinese, English, French, German, Italian, Portuguese, Spanish, etc.).

Section 3—Electronic Trip Systems

M-frame circuit breakers are available with the type ET 1.0 electronic trip system. P-frame and R-frame circuit breakers are available with either the ET1.0I basic electronic trip system or the MicroLogic electronic trip system. The NS630b–NS3200 circuit breakers are available with the MicroLogic electronic trip system. The sensing system responds to the flow of current through the circuit breaker.

Thermal Imaging

The thermal imaging function protects the cables or bus bars from overheating in case of low amplitude repetitive faults. Such overheating can be due to repetitive motor starting, fluctuating load, intermittent ground faults, or subsequent closing after a fault. Traditional electronic protection does not protect against repetitive faults because the duration of each overload above the pickup setting is too short to achieve effective tripping. Nevertheless, each overload involves a temperature rise in the installation, the cumulative effect of which could lead to overheating of the system.

The thermal imaging function remembers and integrates the thermal heating caused by each pickup setting overrun. Before tripping, the integrated heating value will reduce the associated time delay and, therefore, the reaction of the trip unit will be closer to the real heating of the power network system. After tripping, the function will also reduce the time delay when closing the circuit breaker on an overload.

True RMS Current Sensing

The sensing system responds to the flow of current through the circuit breaker. The trip unit samples the current waveform to provide true RMS protection through the fifteenth harmonic. This true RMS sensing gives accurate values for the magnitude of a non-sinusoidal waveform. Therefore, the heating effects of harmonically distorted waveforms are accurately evaluated.

The MicroLogic H trip unit provides additional sampling of the waveforms to measure and provide waveform capture of harmonic distortion to the thirty-first harmonic.

Type ET Electronic Trip System

Type ET trip units are available with M-frame, P-frame and R-frame UL/IEC circuit breakers. Circuit breakers with type ET trip units have a fixed ampere rating. The trip units are not field-interchangeable and will not accept any communications or other trip unit accessories. The trip system uses a set of current transformers (called CTs or sensors) to sense current, a trip unit to evaluate the current, and a tripping solenoid to trip the circuit breaker.

ET1.0 (M-Frame only)

The ET1.0 trip system is available on M-frame circuit breakers with both fixed and adjustable long-time (I_r) setting and adjustable instantaneous (I_i) tripping. The long-time pickup is adjustable from 300 to 800 A. For fixed long-time circuit breakers, there are two circuit breaker amperage ratings. The instantaneous trip is a multiple of this setting from 2–10 x with no intentional time delay. There is additionally an automatic molded case switch available in 600 and 800 A.

ET1.0I (P-Frame and R-Frame only)

The ET1.0I trip system is available on both P-frame and R-frame circuit breakers and is equipped with fixed long-time and adjustable instantaneous tripping functions only. The long-time pickup is fixed at 1.0 x sensor rating (I_n), while the instantaneous pickup is adjustable (dial settings from 1.5–12 x I_n) with no intentional time delay.

ET1.0M (P-Frame only)

The ET1.0M trip system is only available on P-frame motor circuit protectors and provides protection for short circuit conditions only. The trip unit has a single adjustment for instantaneous pickup that, if exceeded, will trip the circuit breaker with no intentional delay. Instantaneous trip dial settings are 2–16 x I_n for 600 A circuit breakers and 1.5–12 x I_n for 800–1200 A circuit breakers.

MicroLogic Electronic Trip Systems

The P-frame, R-frame and NS630b–NS3200 electronic trip circuit breakers can be equipped with the optional MicroLogic trip systems listed below:

MicroLogic Trip Systems

Model	(LS0) Long-time + Short-time + Zero delay (IEC Rated Only)	(LI) Long-time + Instantaneous Protection (UL Listed, IEC Rated)	(LSI) Long-time + Short-time + Instantaneous Protection (UL Listed, IEC Rated)	(LSIG) Long-time + Short-time + Instantaneous Protection + Equipment Ground-fault Protection (UL Listed, IEC Rated)
MicroLogic Basic Trip Unit	2.0	3.0	5.0	—
MicroLogic A Trip Unit	2.0A	3.0A	5.0A	6.0A
MicroLogic P Trip Unit	—	—	5.0P	6.0P
MicroLogic H Trip Unit	—	—	5.0H	6.0H

MicroLogic 3.0 and 5.0 Basic Trip Units

MicroLogic 3.0A, 5.0A and 6.0A Trip Units

MicroLogic 5.0P and 6.0P Trip Units

MicroLogic 5.0H and 6.0H Trip Units

Trip units are designed to protect power circuits and loads. MicroLogic trip systems use a set of current transformers (called CTs or sensors) to sense current, a trip unit to evaluate the current, and a tripping solenoid to trip the circuit breaker. Adjustable rotary switches on the trip unit allow the user to set the proper overcurrent or equipment ground-fault current protection required in the electrical system. If current exceeds a set value for longer than its set time delay, the trip system opens the circuit breaker. Alarms may be programmed for remote indications. Measurements of current, voltage, frequency, power, and power quality optimize continuity of service and energy management.

Integration of protection functions in the Application Specific Integrated Circuit (ASIC) electronic component used in all MicroLogic trip units yields a high degree of reliability and immunity to conducted or radiated disturbances. On MicroLogic P and H trip units, advanced functions are managed by an independent microprocessor.

Circuit breakers are shipped with the trip unit long-time pickup switch set at 1.0 and all other trip unit adjustments set at their lowest settings. Actual settings required for a specific application must be determined by a qualified consultant or plant engineer. A coordination study is recommended to provide coordination between all circuit breakers in the distribution system.

17. 3Ø, 4W circuits require either a neutral current transformer or a 4-pole breaker.

18. Not available for 2.0A trip units as upstream devices.

MicroLogic 2.0, 3.0 and 5.0 Basic Trip Units

The MicroLogic 2.0, 3.0, and 5.0 basic trip units protect power circuits.

Protection Settings

Protection thresholds and delays are set using the rotary switches. A full-range of long-time settings are available via field-installable adjustable rating plugs.

1—Long-time current setting and tripping delay

2—Short-time pickup and tripping delay

3—Overload signal (LED)

4—Long-time rating plug screw

5—Instantaneous pickup

6—Test connector

- Overload protection
 - True RMS long-time protection
 - Thermal imaging: Active thermal imaging before and after tripping
- Short-circuit protection
 - Short-time RMS
 - Selection of I^2t type (ON or OFF) for short-time delay
- Instantaneous protection
- Neutral protection on four-pole circuit breakers

MicroLogic 2.0A, 3.0A, 5.0A and 6.0A Trip Units with Ammeter

- A—Indication of tripping cause
- B—Navigation buttons
- C—Long-time current setting and tripping delay
- D—Short-time pickup and tripping delay
- E—Ground-fault pickup and tripping delay
- F—Test lamp and reset
- G—Digital display
- H—Three-phase bar graph and ammeter
- I—Overload signal (LED)
- J—Long-time rating plug screw
- L—Instantaneous pickup
- L—Electronic push-to-trip
- M—Test connector

MicroLogic A trip units protect power circuits and provide current measurements, overload protection, and short-circuit protection. In addition, the 6.0A trip units also provide ground-fault protection for equipment.

Protection Settings

Protection thresholds and delays are set using the rotary switches. The selected values are momentarily displayed in amperes and in seconds. A full-range of long-time settings are available via the field-installable rating plug:

- Overload protection (true RMS long-time protection)
- Thermal imaging (active thermal imaging before and after tripping)
- Short-circuit protection:
 - Short-time RMS
 - I^2t ON or OFF for short-time delay
- Instantaneous protection
- Ground-fault protection for equipment:
 - Residual ground-fault protection for equipment
 - Source ground-return ground-fault protection for equipment
 - Modified differential ground-fault protection (MDGF) for equipment
- Neutral protection on four-pole circuit breakers
- ZSI: Zone-selective interlocking:
 - ZSI terminal block may be used to interconnect a number of trip units to provide total discrimination for short-time and equipment ground-fault protection, without delay for tripping).
 - Not available for 3.0A trip units or for 2.0A trip units installed as upstream devices.

Ammeter Measurements

MicroLogic A trip units measure the true RMS value of currents. They provide continuous current measurement from 0.2 to 20 x I_n with an accuracy of 1.5% (including sensors). No auxiliary source is needed where $I > 0.2 \times I_n$. The optional external power supply (24 Vdc) makes it possible to display currents where $I < 0.2 \times I_n$ and to store values of the interrupted current.

A digital LCD screen continuously displays the most heavily loaded phase (I_{max}) or displays the I_A , I_B , I_C , I_g , and (on 4P circuit breakers only) I_N stored current and setting values by successively pressing the navigation button.

Communication Network

In conjunction with an optional communication network, the trip unit transmits the following parameters:

- Setting values
- All ammeter measurements
- Tripping causes

	1600–6300 A	500 A	
Modbus Communications (Optional)	No		Yes, with separate 24 Vdc power supply for the circuit breaker communication module
Back-lit Display	No		Yes

19. Ground fault Push-to-trip button will also be functional if hand-held test kit or full-function test kit is powering the trip unit.

MicroLogic 5.0P and 6.0P Trip Units with Power Metering

- A—Indication of tripping cause
- B—High resolution screen
- C—Measurement display
- D—Navigation buttons
- E—Long-time current setting and tripping delay
- F—Short-time pickup and tripping delay
- G—Hole for settings lockout pin
- H—Ground-fault pickup and tripping delay
- I—Test lamp and indication reset
- J—Maintenance indicators
- K—Protection settings
- L—Overload signal (LED)
- M—Long-time rating plug screw
- N—Instantaneous pickup
- O—Electronic push-to-trip
- P—Test connector

MicroLogic P trip units provide power metering and extended protection in addition to the adjustable protection functions of the MicroLogic A trip unit.

Protection Settings

The adjustable protection functions of the 5.0P and 6.0P trip units are identical to those of the MicroLogic A trip unit (overloads, short circuits, equipment ground-fault protection; see *MicroLogic 2.0A, 3.0A, 5.0A and 6.0A Trip Units with Ammeter*, page 55). These units also feature:

- **Fine adjustment**
Within the range below the rotary switch setting, fine adjustments of pickups/ delays in steps of 1 A/s (except for short-time and ground-fault) are possible on the keypad or remotely by the communication network.
- **Inverse definite minimum time lag (IDMTL) setting.**
Coordination with fuse-type or medium-voltage protection systems is optimized by adjusting the long-time delay curve around $6 \times I_r$ axis. This setting ensures better coordination with certain loads.
- **Neutral protection**
On three-pole circuit breakers, neutral protection may be set using the keypad or remotely using the communication network to one of four positions: OFF, 1/2N ($1/2 \times I_n$), 1N ($1 \times I_n$), or 1.6N ($2 \times I_n$).
NOTE: Neutral protection is disabled if long-time curve is set to one of the IDMTL protection settings.

- **Configuring Alarms and Other Protection Functions**

When the cover is closed, the keypad may no longer be used to change the protection settings, but it still provides access to the displays for measurements, histories, indicators, etc. Depending on the thresholds and time delays set, the MicroLogic P trip unit monitors current, voltage, power, frequency, and phase sequence. Each threshold overrun may be signalled remotely via the communication network.

Each threshold overrun may be combined with tripping (protection) or an indication carried out by an alarm programmed accessible with the optional IO module, or both (protection and alarm).

Maintenance Record

The maintenance record can be consulted using the service interface kit or the full-function test kit, or remotely via the communication network. It can be used as an aid in troubleshooting and to assist scheduling for device maintenance operations. Recorded indications include:

- Highest current measured
- Operation counter (cumulative total and total since last reset)
- Number of test kit connections
- Number of trips in operating mode

Load Shedding and Reconnection Parameters

Load shedding and reconnection parameters can be set according to the power or the current flowing through the circuit breaker. Load shedding is carried out by a remote computer via the communication network.

Indication Option Via Programmable Contacts

Alarms may be used to signal threshold overruns or status changes. It can be programmed using the keypad on the MicroLogic P trip unit or remotely using the communication network. The contact is required to obtain data from the protective relay functions on Type P and Type H trip units.

MicroLogic P Trip Units and 24 Vdc Power Supply

MicroLogic P trip units are designed to be used with an external 24 Vdc power supply. Current-based protection functions require no auxiliary power source.

MicroLogic P Trip Units and 24 Vdc Power Supply

Function	Without 24 Vdc Power Supply at F1 and F2	With 24 Vdc Power Supply at F1 and F2
Fault Protection for LSIG Functions	Yes	Yes
LED Trip Indication	Yes	Yes
LCD Display and Backlight are Functional	Yes ²⁰	Yes
Ground-Fault Push-to-Trip Button Works for Testing Ground Fault ²¹	Yes ²⁰	Yes
Metering, Monitoring, and History Logs are Functional	Yes ²⁰	Yes
Communications Between Trip Unit and M2C contacts	No	Yes
Modbus Communications	No	Yes, with separate 24 Vdc power supply for the circuit breaker communication module

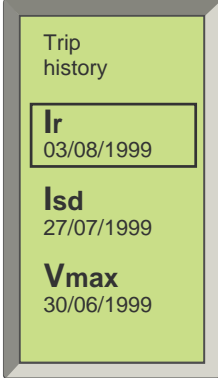

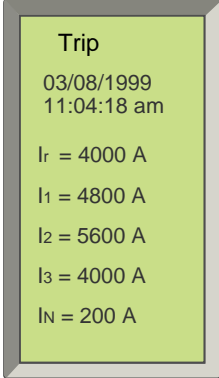

20. If circuit breaker has 100 Vac or more between two phases or phase to neutral and is bottom fed or closed in a top fed application.

21. Ground-fault push-to-trip button will also be functional if the service interface, hand-held test kit, or full-function test kit is powering the trip unit.

MicroLogic Trip Units Tripping and Alarm Histories

The last ten trips and ten alarms are recorded in two separate history files that can be displayed on the screen (sample displays are shown).

The following information is contained in these files:

Trip History	Alarm History
	
<ul style="list-style-type: none"> • Type of fault 	<ul style="list-style-type: none"> • Type of alarm
<ul style="list-style-type: none"> • Date and time of fault 	<ul style="list-style-type: none"> • Date and time of alarm
<ul style="list-style-type: none"> • Interrupted current 	<ul style="list-style-type: none"> • Values measured at time of alarm

MicroLogic Trip Unit Metering

The MicroLogic P trip unit calculates in real time the electrical values V, A, W, VAR, VA, Wh, VARh, VAh, Hz, power factor and crest factor. It also calculates demand current and power over an adjustable time period.

Real-Time Metering

The value displayed on the screen is refreshed every second. Minimum and maximum measurement values are stored in memory.

Type of Measurement		Unit of Measurement	Measurement Source
Current	I _{RMS} I _{AVERAGE} I _{PEAK} /√2	A A A	ØA, ØB, ØC or N (ØA + ØB + ØC) / 3 ØA, ØB, ØC or N
Voltage	V _{RMS} V _{RMS} ΔV _{IMBALANCE}	V V %	(ØA-ØB), (ØB-ØC) and (ØC-ØA) (ØA-N), (ØB-N) and (ØC-N) V _{RMS}
Power	P, Q and S EP, EQ and ES Power factor	W, VAR, VA Wh, VARh, VAh	Total Total Total
Frequency	F	Hz	50/60

Demand Metering

The demand is calculated over a fixed or sliding time window that can be programmed from five to sixty minutes. Depending on the contract signed with the power supplier, specific programming makes it possible to avoid or minimize the cost of overrunning the subscribed power. Maximum demand values are systematically stored and time stamped.

Type of Measurement		Unit of Measurement	Measurement Source
Current	I _{DEMAND}	A	ØA, ØB, ØC or N
Power	P, Q and S _{DEMAND}	W, VAR, VA	Total

MicroLogic Communication Network

The communication network may be used to:

- Remotely read parameters for the protection functions.
- Transmit all the measurements and calculated values.
- Signal the causes of tripping and alarms.
- Consult the history files and the maintenance indicator record.

In addition, an event log of the last 100 events and a maintenance record, which is stored in the trip unit memory but not available locally, may be accessed via the communication network.

This Modbus communication system is compatible with the PowerLogic™ System Manager software (SMS).

MicroLogic Event Log

The event log may be accessed by a remote computer via the communication network. All events are time stamped and include:

- Trips
- Beginning and end of alarms
- Modifications to settings and parameters
- Loss of time
- Test kit connections
- Counter resets
- System faults (thermal self-protection, major fault and minor fault alarms)

MicroLogic 5.0H and 6.0H Trip Units with Harmonic Metering

In addition to the P functions, the MicroLogic H trip units offer:

- In-depth analysis of power quality including calculation of harmonics and the fundamentals.
- Diagnostics aid and event analysis through waveform capture.
- Customized alarm programming to analyze and track down a disturbance on the ac power system.
- Systematic time stamping of all events and creation of logs.

Metering

The MicroLogic H trip unit offers all the measurements carried out by the MicroLogic P trip unit, with the addition of phase-by-phase measurements of power and energy as well as calculation of:

- Current and voltage total harmonic distortion (THD)
- Current, voltage and power fundamentals (50/60 Hz)
- Harmonic components (amplitude and phase) up to the 31st current and voltage harmonic
- Real-time metering: The value displayed on the screen is refreshed every second. The table below shows what is measured in real-time metering.

Measurements

Type of Measurement	Unit of Measurement	Measurement Source
Current	IRMS I AVERAGE I PEAK/√2 Δ I IMBALANCE	A A A %
Voltage	VRMS V RMS Δ V IMBALANCE	V V % ØA, ØB, ØC or N (ØA + ØB + ØC) / 3 ØA, ØB, ØC or N ØA, ØB, ØC or N VRMS
Power	P, Q and S EP, EQ and ES Power factor	W, VAR, VA Wh, VARh, VAh
Frequency	F	Total Total Total Hz ØA, ØB, or ØC
Power Quality Indicators	Fundamentals THD V and I harmonics	50/60 Hz component % Amplitude to phase V, I, P, Q, and S V/I 1, 2, 3, 4...50

Demand Metering: Similar to the MicroLogic P trip unit, demand values are calculated over a fixed or sliding time window that can be set from five to sixty minutes.

Type of Measurement		Unit of Measurement	Measurement Source
Current	I_{DEMAND}	A	$\emptyset A, \emptyset B, \emptyset C$ or N
Power	P, Q and S_{DEMAND}	W, VAR, VA	Total

Waveform Capture

The MicroLogic H trip units can capture and store current and voltage waveforms using digital sampling techniques similar to those used in oscilloscopes. Using the information available in the captured waveform, it is possible to determine the level of harmonics as well as the direction and amplitude of the flow of harmonic power.

The MicroLogic H trip unit can record manually via the keypad the following waveforms:

- Currents I_A, I_B, I_C and I_N
- Phase-to-phase voltages $V_{AB}, V_{BC},$ and V_{CA}

Waveforms may be displayed on the graphic screen of the control unit or communicated over a networked system. The recording takes place over one cycle with a measurement range of 1 to $1.5 I_n$ for current and 0 to 690 volts for voltage. Resolution is 64 points per cycle.

Customized Alarm Programming

The instantaneous value of each measurement can be compared to user-set high and low thresholds. Overrun of a threshold generates an alarm. Programmable action can be linked to each alarm, including circuit breaker opening, recording of measurements in a log, etc.

Event Logs

Each event is recorded with:

- The date, time, and name of the event
- The event characteristics

MicroLogic H trip units are designed to be used with an external 24 Vdc power supply. Current-based protection functions require no auxiliary power source.

MicroLogic H Use of External 24 Vdc Power Supply

Function	Without 24 Vdc Power Supply at F1 and F2	With 24 Vdc Power Supply at F1 and F2
Fault Protection for LSIG Functions	Yes	Yes
LED Trip Indication	Yes	Yes
LCD Display and Backlight are Functional	Yes ²²	Yes
Ground-Fault Push-to-Trip Button Works for Testing Ground Fault ²³	Yes ²²	Yes
Metering, Monitoring, and History Logs are Functional	Yes ²²	Yes
Communications Between Trip Unit and M2C Programmable Contacts	No	Yes
Modbus Communications	No	Yes, with Separate 24 Vdc Power Supply for the Circuit Breaker Communication Module

22. If circuit breaker has 100 Vac or more between two phases or phase to neutral and is bottom fed or closed in a top fed application.

23. Ground-fault push-to-trip button will also be functional if the service interface, the hand-held test kit, or the full-function test kit is powering the trip unit.

Additional Characteristics for Type P and H Trip Units

- Setting the display language: System messages can be displayed in six different languages (English - US, English - UK, French, German, Spanish, and Italian). The desired language is selected via the keypad.
- Protection functions: All current-based protection functions require no auxiliary source. Voltage-based protection functions are connected to ac power via a voltage measurement input built into the circuit breaker on the bottom side. An optional external voltage measurement is available as a factory-installed option.
- Accuracy of measurements (including sensors):
 - Voltage (V) 1%
 - Current (A) 1.5% (higher accuracy [1%] may be achieved with special calibration on the current transformer [CT characterization option])
 - Frequency (Hz) 0.1 Hz
 - Power (W) and energy (Wh) 2.5%

The MicroLogic H trip unit uses a dedicated metering data chain separate from the protection data chain so that a greater number of data samples can be used for metering. This increases the number of samples taken per time period, which in turn gives the H trip unit a higher degree of metering accuracy.

- Stored information: The fine setting adjustments, the last 100 events and the maintenance record remain in the trip unit memory even when power is lost.
- Reset: An individual reset, via the keypad or remotely, will reset alarms, minimum and maximum data, peak values, counters and indicators.

MicroLogic Trip Unit Functions

Long-Time Trip Functions

Long-Time Trip Functions

The *long-time pickup* switch sets the maximum current level the circuit breaker will carry continuously. The maximum current level (I_r) is the long-time pickup setting multiplied by the sensor plug amperage (I_n). If the current exceeds this value for longer than the long-time delay time, the circuit breaker will trip.

The *long-time delay* switch sets the length of time that the circuit breaker will carry a sustained overload before tripping. Delay bands are labeled in seconds of overcurrent at six times the ampere rating. For maximum coordination, there are eight delay bands. Long-time delay is an “inverse time” characteristic in that the delay time decreases as the current increases.

The trip unit includes an *alarm indicator* that will be lit continuously when the current is above 100% of the pickup setting.

Short-Time Trip Functions

The *short-time pickup* switch sets the short-circuit current level at which the circuit breaker will trip after the set short-time delay. The short-time current (I_{sd}) equals the short-time pickup setting multiplied by the long-time pickup (I_r).

The *short-time delay* switch sets the length of time the circuit breaker will carry a short circuit within the short-time pickup range. The delay (based on 10 times the ampere rating I_r) can be adjusted to four positions of I^2t ramp operation (I^2t ON) or five positions of fixed time delays (I^2t OFF). I^2t ON delay is an “inverse time” characteristic in that the delay time decreases as the current increases. Short-time delay for the 2.0 trip unit is fixed at a delay band of 20 to 80 ms.

Instantaneous Trip Function

The *instantaneous pickup* switch sets the short-circuit current level at which the circuit breaker will trip with no intentional time delay. The instantaneous current (I_i) is equal to the instantaneous pickup setting multiplied by the sensor plug amperage (I_n).

The instantaneous function will override the short-time function if the instantaneous pickup is adjusted at the same or lower setting than the short-time pickup. In trip units with both adjustable short-time and instantaneous trip functions, the adjustable instantaneous trip can be disabled by setting Instantaneous pickup to OFF.

Ground-Fault Trip Functions

The *ground-fault pickup* switch sets the current level at which the circuit breaker will trip after the set ground-fault delay. Ground-fault pickup values (I_g) are based on circuit breaker sensor plug (I_n) only, not on the rating plug multiplier (I_r). Changing the rating plug multiplier has no effect on ground-fault pickup values.

The *ground-fault delay* switch sets the length of time the circuit breaker will carry ground-fault current which exceeds the ground-fault pickup level before tripping. The delay, based on the sensor plug amperage (I_n), can be adjusted to four positions of I^2t ramp operation (I^2t ON) or five positions of fixed time delays (I^2t OFF). I^2t ON delay is an “inverse time” characteristic in that the delay time decreases as the current increases.

Short-Time Trip Functions

Ground-Fault Trip Functions

Smart System Communication Wiring System

Wiring System ULP

The wiring system is designed for low-voltage power switchboards. Installation does not require special tools or training. The prefabricated wiring simplifies both data transmission (Modbus protocol) and 24 Vdc power distribution for the communications modules on the MicroLogic trip units.

- A. FDM128 display for 8 LV devices
- B. IFE Ethernet interface for LV circuit breaker and gateway
- C. IFM Modbus-SL interface for LV circuit breaker
- D. FDM121 display for LV circuit breaker
- E. IO input/output interface module for LV circuit breaker
- F. MasterPacT NT/NW circuit breaker

- G. PowerPacT H-, J-, or L-frame circuit breaker
- H. ULP line terminator
- I. ULP cable
- J. Breaker ULP cord
- K. NSX cord
- L. PowerPacT P/R or ComPacT NS

Smart System Four Functional Levels

The PowerPacT and ComPacT devices can be integrated into Ethernet and Modbus communication environment.

There are four possible functional levels that can be combined.

A: MicroLogic trip unit with ammeter

P: MicroLogic trip unit "Power"

H: MicroLogic trip unit "Harmonics"

See the section on the MicroLogic trip units for details about the trip units.

Functional Level	Switch	Circuit Breaker		
Status Indications				
ON/OFF (O/F)	X	A	P	H
Spring charged	X	A	P	H
Ready to close	X	A	P	H
Fault-trip SDE	X	A	P	H

Smart System Modbus Principle

The Modbus RS 485 (RTU protocol) system is an open bus on which communicating Modbus devices (MasterPacT NW with Modbus COM, Power Meter PM700, PM800, PowerPacT P/R-frame, etc.) are installed. All types of PLCs and microcomputers may be connected to the bus.

Addresses

The Modbus communication parameters (address, baud rate, parity) are entered using the keypad on the MicroLogic A, P, or H trip unit. For a switch, it is necessary to use the Electrical Asset Manager or RSU (Remote Setting Utility) MicroLogic utility.

Number of Devices

The maximum number of devices that may be connected to the Modbus bus depends on the type of device (PowerPacT circuit breaker with Modbus COM, PM700, PM800, MasterPacT circuit breaker, etc.), the baud rate (19200 is recommended), the volume of data exchanged and the desired response time. The RS 485 physical layer offers up to thirty-two connection points on the bus (one client, thirty-one servers).

Length of Bus

The maximum recommended length for the Modbus bus is 3940 feet (1200 meters).

Bus Power Source

A 24 Vdc power supply is required (less than 20% ripple, insulation class II).

Smart System Ethernet Principle

Ethernet is a data link and physical layer protocol defined by IEEE 802.10 and 100 Mbps specifications that connects computer or other Ethernet devices. Ethernet is an asynchronous Carrier Sense Multiple Access with Collision detection (referred as CSMA/CD) protocol. Carrier Sense means that the hosts can detect whether the medium (coaxial cable) is idle or busy.

Multiple Access means that multiple hosts can be connected to the common medium. Collision Detection means a host detects whether its transmission has collided with the transmission of another host (or hosts).

IFE Ethernet interface can be connected to a PC or a laptop over Ethernet. The maximum length of Ethernet cable is 325 feet (100 meters). IFE Ethernet interface + gateway provides a Modbus TCP/IP gateway over Ethernet to enable Modbus TCP communication from a Modbus TCP client to any Modbus server devices connected to it. The maximum active Modbus TCP client connection is twelve.

IFE Ethernet interface has an embedded web server (web page).

COM Option in PowerPacT and ComPacT Circuit Breakers

All PowerPacT and ComPacT devices can be fitted with the communication function thanks to the COM option. PowerPacT and ComPacT uses the Ethernet or Modbus communications protocol for full compatibility with the supervision management systems.

For fixed and drawout devices, the common communication option is made up of:

- A BCM ULP module, installed behind the MicroLogic trip unit and supplied with a set of switches (OF, SDE, PF and CH switches), a kit for connection to shunt close (XF) and shunt trip (MX1) communicating voltage releases (for electrically operated devices), and a COM terminal block (inputs E1 to E6). This module is independent of the trip unit and receives and transmits information on the communication network. An infra-red link transmits data between the trip unit and the communication module.
Consumption: 30 mA, 24 V.

BCM ULP Module

and

- The IFM module, the Modbus interface for connection to the network, contains the Modbus address (1 to 99) declared by the user using the two dials in front. It automatically adapts (baud rate, parity) to the Modbus network in which it is installed.

or

- The IFE module, the Ethernet interface for low-voltage circuit breakers, enables an intelligent modular unit (IMU) such as a MasterPacT NT/NW or PowerPacT circuit breaker to be connected to an Ethernet network. Each circuit breaker has its own IFE and a corresponding IP address.

For drawout device the Cradle Management option must be added:

The I/O (Input/Output) application module for low-voltage circuit breakers is delivered with the drawout devices ordered with the COM option for cradle management. It must be installed on a steel DIN rail that is properly grounded near the device. The I/O module must be connected to the ULP system and to the cradle position contacts (CD, CT, CE) that transmit the position of the circuit breaker in the cradle.

For communicating remote control for electrically operated devices, shunt close (XF) and shunt trip (MX1) communicating voltage releases must be added:

I/O Application Module

The shunt close (XF) and shunt trip (MX1) communicating voltage releases are equipped for connection to the communication module.

The remote-tripping function shunt trip (MX2) and undervoltage release (MN) are independent of the communication option. They are not equipped for connection to the communication module.

Fixed Devices

Drawout Devices

- A. BCM ULP
- B. OF, SDE, SD, PF, CH (tripped, open/closed, overcurrent trip, ready to close, charged Switches
- C. COM Terminal Block (E1 to E6)
- D. Shunt Trip (MX1) and Shunt Close (XF)
- E. CE, CD, and CT (connected, disconnected, test) contacts
- F. Circuit Breaker ULP Cord
- G. I/O Application Module
- H. ULP Cable
- I. IFE Module
- J. IFM Module

Smart System IFE Ethernet Interface

IFE Interface, IFE Interface + Gateway Description

IFE Interface

IFE Interface + Gateway

Introduction

The IFE interface and IFE interface + gateway enable low-voltage circuit breakers such as MasterPact NT/NW or PowerPact P/R-frame to be connected to an Ethernet network.

IFE Interface

Provides Ethernet access to a single low-voltage circuit breaker.

Function: Interface - one circuit breaker is connected to the IFE interface using its ULP port.

IFE Interface + Gateway

Provides Ethernet access to one or several low-voltage circuit breakers.

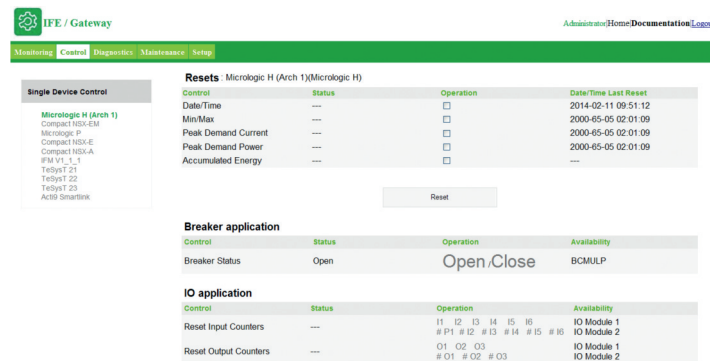

Functions:

- Interface - one circuit breaker is connected to the IFE interface using its ULP port.
- Gateway: several circuit breakers on a Modbus network are connected using the IFE interface + gateway client Modbus port.

IFE Interface, IFE Interface + Gateway Features

- Dual 10/100 Mbps Ethernet port for simple daisy chain connection.
- Device profile web service for discovery of the IFE interface, IFE interface + gateway on the LAN.
- Ethernet interface for MasterPact and PowerPact circuit breakers.
- Gateway for Modbus-SL connected devices (IFE interface + gateway only).
- Embedded set-up web pages.
- Embedded monitoring web pages.
- Embedded control web pages.
- Built-in e-mail alarm notification.

IFE Interface, IFE Interface + Gateway Screen

IFE Interface Mounting

The IFE interface and IFE interface + gateway are DIN rail mounting devices. A stacking accessory enables the user to connect several IFMs (ULP to Modbus interfaces) to an IFE interface + gateway without additional wiring.

IFE Interface 24 Vdc Power Supply

The IFE interface and the IFE interface + gateway must always be supplied with 24 Vdc power.

The IFMs stacked to an IFE interface + gateway have power supplied by the IFE interface + gateway, thus it is not necessary to supply them separately. It is recommended to use a UL listed and recognized limited voltage/limited current or a class 2 power supply with a 24 Vdc, 3 A maximum.

IFE Interface Required Circuit Breaker Communication Modules

The connection to an IFE interface or IFE interface + gateway requires a communication module embedded into the circuit breaker:

- PowerPacT and ComPacT circuit breakers: BCM ULP communication module
- Drawout PowerPacT and ComPacT circuit breakers: BCM ULP and its respective I/O (Input/Output) application module.

All connection configurations for the circuit breakers require the circuit breaker ULP cord. The insulated NSX cord is mandatory for system voltages greater than 480 Vac. When the second ULP RJ45 connector is not used, it must be closed with a ULP terminator (TRV00880).

Characteristic		Value
Type of interface module		Modbus RTU, RS485 serial connection Modbus TCP/IP Ethernet
Transmission	Modbus RS485	Transfer rate: 9,600–19,200 Baud Medium Double shielded twisted pair Impedance 120 Ω
	Ethernet	Transfer rate: 10/100 Mbps Medium STP, Cat5e, straight cable

General Characteristics

Environmental Characteristics	
Conforming to standards	UL 508, UL 60950, IEC 60950, 60947-6-2
Certification	cUIUs, FCC, CE
Ambient temperature	Storage: -40 to +185°F (-40 to +85°C) Operation: -13 to +158°F (-25 to +70°C)
Protective Treatment	ULVO, conforming to IEC 60068-2-30
Pollution	Level 3
Mechanical Characteristics	
Shock resistance	Conforming to IEC 60068-2-27 15g/11ms, 1/2 sinusoidal
Resistance to sinusoidal vibrations	Conforming to IEC 60068-2-6
Electrical Characteristics	
Power Supply	24 Vdc, -20%/+10% (19.2 to 26.4 Vdc)
Consumption	Typical: 4 Vdc, 120 mA at 68°F (20°C) Maximum with gateway: 26.4 Vdc, 3 A at 140°F (60°C)
Physical Characteristics	
Dimensions	2.83 x 4.13 x 2.79 in. (72 x 105 x 71 mm)
Mounting	Mounting DIN rail
Weight	182.5 g (0.41 lb)
Degree of protection of the installed module	On the front panel (wall mounted enclosure): IP4x Connectors: IP2x Other parts: IP3x
Connections	Screw type terminal blocks
Technical Characteristics - 24 Vdc Power Supply	
Power supply type	Regulated switch type
Rated power	72 W
Input voltage	100–120 Vac for single phase 200–500 Vac phase-to-phase
PFC filter	With IEC 61000-3-2
Output voltage	24 Vdc
Power supply out current	3 A

NOTE: Use a UL Listed / UL Recognized limited voltage / limited current or a Class 2 power supply with a 24 Vdc, 3 A maximum.

Smart System IFM Modbus Communication Interface

IFM Interface Function

IFM Modbus
Communication Interface
TRV00210

An IFM Modbus communication interface is required for connection of a MasterPacT or PowerPacT circuit breaker to a Modbus network as long as this circuit breaker is provided with a ULP (Universal Logic Plug) port. The port is available on the BCM ULP.

Once connected, the circuit breaker is considered as a server by the Modbus client. Its electrical values, alarm status, open/close signals can be monitored or controlled by a Programmable Logic Controller or any other system.

IFM Interface Characteristics

ULP Port

Two RJ45 sockets, internal parallel wiring.

- Connection of a single circuit breaker.
- A ULP line terminator or an FDM121 display unit must be connected to the second RJ45 ULP socket.
- The RJ45 sockets deliver a 24 Vdc supply fed from the Modbus socket.
- Built-in test function, for checking the correct connection to the circuit breaker and FDM121 display unit.

Modbus Server Port

- Top socket for screw-clamp connector, providing terminals for:
 - 24 Vdc input supply (0 V, +24 V)
 - Modbus line (D1, D2, Gnd) 2-wire Modbus system.
- Lateral socket, for DIN-rail stackable connector. Both top and lateral sockets are internally parallel wired.
- Multiple IFMs can be stacked, thus sharing a common power supply and Modbus line without individual wiring.
- On the front face:
 - Modbus address setting (1 to 99): two coded rotary switches
 - Modbus locking pad: enables or disable the circuit breaker remote control and modification of IFM parameters.
- Self-adjusting communication format (Baud rate, parity).

IFM Interface Technical Characteristics

Dimensions		0.71 x 2.83 x 3.78 in. (18 x 72 x 96 mm)
Maximum number of stacked IFM		12
Degree of protection of the installed module	Part projecting beyond the escutcheon	IP4x
	Other module parts	IP3x
	Connectors	IP2x
Operating temperature		-25 to +70°C
Power supply voltage		24 Vdc -20%/+10% (19.2–26.4 Vdc)
Consumption	Typical	21 mA/24 Vdc at 68°F (20°C)
	Maximum	30 mA/19.2 Vdc at 140°F (60°C)
Certification	CE	IEC/EN 60947-1
	UL	UL 508 - Industrial Control Equipment

Stacking an IFE Interface + Gateway with IFMs

Smart System I/O Application Module

I/O Application Module Description

I/O Application Module

The I/O (Input/Output) application module for an low-voltage circuit breaker is part of an ULP system with built-in functions and applications to enhance the application needs. The ULP system architecture can be built without any restrictions using the wide range of circuit breakers.

The I/O application module is compliant with the ULP system specifications.

Two I/O application modules can be connected in the same ULP network.

The ranges of low-voltage circuit breakers enhanced by the I/O application module are:

- MasterPacT NW
- MasterPacT NT
- PowerPacT R-Frame
- PowerPacT P-Frame
- ComPacT NS

I/O (Input/Output) Application Module for Low-Voltage Circuit Breaker Resources

The I/O application module resources are:

- Six digital inputs that are self powered for either NO and NC dry contact or pulse counter
- Three digital outputs that are a bistable relay (5 A maximum)
- One analog input for PT100 temperature sensor

I/O Application Module Pre-Defined Application

The pre-defined application adds new functions to the I/O application module by:

- Selection by the application rotary switch on the I/O application module, defining the application with pre-defined input/output assignment and wiring diagram.
- No additional setting with the customer engineering tool required.

The resources not assigned to the pre-defined application are free for additional user-defined applications:

- cradle management
- circuit breaker operation
- cradle management + ERMS (Energy Reduction Maintenance Setting)

NOTE: Use only MicroLogic P or H trip units with the blue ERMS label for energy reduction maintenance setting systems. Review the I/O module user guide 0613IB1317 and ERMS installation instructions NHA67346 for details on installation, testing, and operation of the ERMS system.

- light and load control
- custom

I/O Application Module User-Defined Applications

User-defined applications are processed by the I/O application module in addition to the pre-defined application selected.

The user-defined applications are available depending on:

- the pre-defined application selected
- the I/O application module resources (inputs and outputs) not used by the application.

The resources required by user-defined applications are assigned using the customer engineering tool:

- protection
- control
- energy management
- monitoring

I/O Application Module Mounting

The I/O application module is a DIN rail mounted device. Install on a steel DIN rail that is properly grounded near the device.

I/O Module Application Rotary Switch

The application rotary switch enables the selection of the pre-defined application. It has nine positions and each position is assigned to a pre-defined application. The factory set position of the switch is pre-defined application one.

I/O Application Module Setting Locking Pad

The setting locking pad on the front panel of the I/O application module enables the setting of the I/O application module by the customer engineering tool.

I/O Application Module General Characteristics

- A. 24 Vdc power supply terminal block
- B. Digital input terminal block: 6 inputs, 3 commons and 1 shield
- C. 6 input status LEDs
- D. Analog input status LED
- E. 3 output status LEDs
- F. I/O application module identification labels
- G. Sealable transparent cover
- H. Analog input terminal block
- I. Digital output terminal blocks
- J. ULP status LED
- K. Test/reset button (accessible with cover closed)
- L. Setting locking pad
- M. Application rotary switch: 1 to 9
- N. Switch for I/O addressing (I/O 1 or I/O 2)
- O. ULP connectors

General Characteristics

Environmental Characteristics	Conforming to standards	UL 508, UL 60950, IED 60950, 60947-6-2

EcoStruxure™ Power Commission Software

Introduction to EcoStruxure Power Commission Software

The EcoStruxure engineering tool is a software application that helps the user to manage a project as part of designing, testing, site commissioning, and maintenance of the project life cycle. It enables the user to prepare the settings of the devices offline (without connecting to the device) and configure them when connected with the devices. It also provides other value-added features for the user to manage the project such as: safe repository in cloud, attach artifacts to each device or at the project level, organize devices in switchboard, manage a hierarchical structure of the installation, etc.

Compatible Devices (Configuration and Device Management)

The EcoStruxure engineering tool is compatible with the following devices:

- ComPacT NSX100-630 (IEC) circuit breakers
- PowerPacT (UL) circuit breakers
- ComPacT NS630b-3200 (IEC) circuit breakers
- MasterPacT NT/NW (IEC and UL) circuit breakers
- Compatible devices (Device Management in the project)
- Switches (ComPacT NSX, MasterPacT and PowerPacT Family)
- Third party devices

References:

The EcoStruxure software package can be downloaded from our website:

www.se.com

Features

The EcoStruxure engineering tool includes the Schneider Electric customer engineering tools such as the Remote Setting Utility (RSU) and Remote Control Utility (RCU) with additional features.

The EcoStruxure engineering tool supports the connection of Schneider Electric communicable devices to:

- create projects by device discovery, selection of devices, and importing a Bill of Material (BOM)
- monitor the status of protection and I/O status
- read information (alarms, measurements, parameters)
- check protection discrimination between two devices
- upload and download of configuration or settings in batch mode to multiple devices.
- carry out commands and tests
- generate and print a device settings report and communication test report
- manage multiple devices with an electrical and communication hierarchy model
- manage artifacts (project documents)
- check consistency in settings between devices on a communication network
- compare configuration settings between PC and device (online)
- download latest firmware

The EcoStruxure engineering tool enables the user to access the advanced features of the software once the project is saved in the Schneider Electric cloud.

Section 4—PowerPacT M-Frame Molded Case Circuit Breakers

PowerPacT M-Frame Performance

M-Frame Unit-Mount

M-Frame I-Line

PowerPacT M-frame molded case circuit breakers provide improved performance and a compact solution for applications up to 800 A. The electronic trip unit simulates the function of a thermal magnetic trip unit, but provides precise tripping and is not sensitive to temperature changes. The adjustable amperage version has a selector switch allowing it to be set to the desired amperage. This can be sealed behind a clear door with the seal kit which is included with the circuit breaker.

- Available in 400 and 600 A fixed trip unit, and adjustable 300–800 A trip unit.
- Available in two- and three-pole unit-mount and I-Line versions

Termination Options

Frame	Termination Letter	Termination Option
M-Frame	F	No Lugs
	A	I-Line
	L	Lugs both ends
	M	Lugs ON end Terminal Nut Kit Off end
	P	Lugs OFF end Terminal Nut Kit On end

For factory-installed termination, place termination letter in the third block of the circuit breaker catalog number.

M,G,L,3,6,4,0,0 or D,G,L,3,6,4,0,0,E,2,0
└─── Termination ───┘

- Built-in electronic trip unit type provides better accuracy than standard thermal-magnetic trip units.
- Fixed long-time and adjustable instantaneous protection (2 to 10 times nominal ampere rating) is standard.
- Available in 400 and 600 A with a fixed amperage rating, and an adjustable amperage rating ranging from 300 to 800 A.
- Same dimensions, common mounting, bussing, cabling and door cut-out as PowerPacT P-frame circuit breakers.
- A full range of electrical accessories are available:
 - Shunt trip (various AC and DC voltages are available)
 - Undervoltage trip (various AC and DC voltages are available)
 - Time delayed undervoltage trip (various AC and DC voltages are available)
 - Auxiliary switches (up to 3A/3B); low-level switches are also available (voltage and amperage)
 - Alarm switch (1A/1B); low-level switches are also available (voltage and amperage)
- Overcurrent trip switch (SDE)

- A full range of mechanical accessories are available:
 - Standard mechanical lugs (aluminum or copper)
 - Crimp (compression) lugs (aluminum or copper)
 - Power distribution lugs (aluminum only)
 - Bus connector kit
 - Inter-phase barriers
 - Door escutcheons (for toggle or accessory cover)
 - Padlocking device (removable or fixed version), complies with OSHA requirements
 - Key-lock device (Kirk® or Schneider Electric keylocks)

M-Frame I-Line

PowerPacT M-Frame Termination Information

Unit-mount circuit breakers have mechanical lugs standard on both ends. I-Line circuit breakers have lugs standard on the OFF end. These lugs accept aluminum or copper wire. See Mechanical, Compression, and Distribution Lugs, page 150 for more lug options.

PowerPacT M-Frame Accessories

Accessories are available either factory- or field-installed. They can be installed in accessory compartments behind the circuit breaker accessory cover. See Accessories Catalog Numbers, page 130 for available accessories.

PowerPacT M-Frame Control Wiring

Control wiring is connected to terminals located under the circuit breaker accessory cover.

NOTE: All diagrams show circuit breaker in open position.

Section 5—PowerPacT P-Frame Molded Case Circuit Breakers

PowerPacT P-Frame Performance

P-Frame Unit-Mount

P-Frame I-Line

P-Frame Drawout

Providing unparalleled performance and control, the P-frame circuit breakers features the exclusive MicroLogic electronic trip units, which allow for a range of sophisticated applications for metering and monitoring. In addition, trip units can be interchanged in the field to allow for maximum flexibility.

The compact size and small footprint of the P-frame circuit breaker permits high density installations in I-Line panelboards and switchboards. These circuit breakers are available in 100% rated construction for all unit-mount circuit breakers and up to 800 A in I-Line circuit breakers to meet a broad range of commercial and industrial application needs.

- Both standard (80%) and 100% rated construction circuit breakers are available in 1200 A with a sensor size range of 250–1200 A.
- Interrupting ratings (AIR):

Voltage	G	J	K	L
240 Vac	65 kA	100 kA	65 kA	125 kA
480 Vac	35 kA	65 kA	50 kA	100 kA
600 Vac	18 kA	25 kA	50 kA	25 kA

- The P-frame circuit breakers with K interrupting rating are recommended for applications having high inrush and/or non-linear loads such as large motors, transformers, motors with soft starts, etc.
- ComPacT circuit breaker size allows for small footprint installations using I-Line panelboards and switchboards. Nine inch width provides increased density installation.
- Most field-installable accessories are common to all frame sizes for easier stocking and installation
- Selection of four interchangeable MicroLogic trip units available, with PoweLogic power metering and monitoring capabilities available in advanced trip units.
- Field-installable sensor plugs. See *Sensor Plugs*, page 142.
- Compatible with PowerLogic systems and high amperage power circuit breakers.
- Built-in Modbus protocol provides an open communications platform and eliminates the need to purchase additional, proprietary network solutions.
- Connection options include bus, cable or I-Line for installation flexibility.
- Additional options are available for 5-cycle closing, stored energy mechanisms and drawout-mounting.

26. The L interrupting rating at 600 Vac is 25 kA.

27. Catalog numbers are for circuit breakers with lugs on line and load ends. Consult the *Product Selector* for catalog numbers for circuit breakers with alternate terminations

28. 250 A is not available as a four pole circuit breaker.

29. For 2P, replace the leading 3 in the catalog number following the prefix with a 2 (PGL36025 becomes PGL26025).

30. For 4P (available in G and K interrupting levels only), replace the leading 3 in the catalog number following the prefix with a 4 (PGL36040U31A becomes PGL46040U31A).

31. Add E1 suffix for Modbus communications.

32. For 4P (available in G and K interrupting levels only), replace the leading 3 in the catalog number following the prefix with a 4 (PGL36040U31A becomes PGL46040U31A).

41. 250 A is not available as a four pole circuit breaker.

42. For 4P (available in G and K interrupting levels only), replace the leading 3 in the catalog number following the prefix with a 4 (PGL36040CU31A becomes PGL46040CU31A).

48. The L interrupting rating at 600 Vac is 25 kA.
 49. No suffix is for ABC phasing (standard offer), or use 6 for CBA phasing (option).
 50. Add E1 suffix for Modbus communications.

P-Frame Interrupting Ratings

Voltage	P-Frame Interrupting Rating			
	G	J	K	L
240 Vac	65 kA	100 kA	65 kA	125 kA
480 Vac	35 kA	65 kA	50 kA	100 kA
600 Vac	18 kA	25 kA	50 kA	25 kA

P-Frame Termination Options

F = No Lugs (Includes terminal nut kit on both ends)

L = Lugs both ends

M = Lugs I/ON end, terminal nut kit O/OFF end

P = Lugs O/OFF end, terminal nut kit I/ON end

D = Drawout

A = I-Line

For factory-installed termination, place termination letter in the third block of the circuit breaker catalog number.

P|G|L|3|6|0|4|0|U|4|1|A
 Termination Letter

PowerPacT P-Frame Continuous Current Rating

All circuit breakers marked as 100% rated can be continuously loaded to 100% of their rating.

Because of additional heat generated when applying circuit breakers at 100% of continuous current rating, the use of specially-designed enclosures and 194°F (90°C) wire is required. The 194°F (90°C) wire must be sized according to the ampacity of the 167°F (75°C) wire column in the NEC. Minimum enclosure size and ventilation specifications are indicated on the circuit breaker, in its instruction bulletin, and in Enclosure Sizes, page 11.

Circuit breakers with 100% rating can also be used in applications requiring only 80% continuous loading.

51. Non-standard AIR.

PowerPacT P-Frame Automatic Molded Case Switches

Automatic molded case switches are available in individually-mounted and I-Line constructions from 600–1200 A. Automatic switches are similar in construction to electronic trip circuit breakers except that long-time tripping is not present. The switches open instantaneously at a non-adjustable magnetic trip point calibrated to protect only the molded case switch itself. They must be used in conjunction with a circuit breaker or fuse of equivalent rating.

52. Catalog numbers for automatic switches are designed by “000” in positions 7–9 (ampere rating) and S60, S80, S10, or S12 in positions 11–14 (trip system). See Catalog Number for M-, P- and R-Frame (UL/IEC Dual-Rated) Circuit Breakers, page 18.
53. For 2P, replace the leading 3 in the catalog number following the prefix with a 2 (PJL36000S60 becomes PJL26000S60). Add the suffix 2 for AC phasing (standard offer), or use 5 for CA phasing (option).
54. For 2P, replace the leading 3 in the catalog number following the prefix with a 2 (PJL36000S60 becomes PJL₂6000S60). Add the suffix 2 for AC phasing (standard offer), or use 5 for CA phasing (option).
55. For 4P, replace the leading 3 in the catalog number following the prefix with a 4 (PKL36000S60 becomes PKL46000S60).

PowerPacT P-Frame Motor Circuit Protectors

Motor circuit protectors⁵⁶ are similar in construction to thermal-magnetic circuit breakers, but have only instantaneous trip functions provided by the ET1.0M trip unit. These motor circuit protectors comply with NEC requirements for providing short-circuit protection when installed as part of a listed combination controller having motor overload protection. Interrupting ratings are determined by testing the motor circuit protector in combination with a contactor and overload relay.

Motor circuit protectors are available in PJ and PL individually-mounted and I-Line construction. According to the NEC, the instantaneous trip of the motor circuit protector may be set to a maximum of 8 to 17 times motor Full Load Amps (FLA), but a setting as close as possible to inrush current (without nuisance tripping) results in the best protection. The instantaneous trip pickup level is adjustable within the ranges shown below.

Motor Circuit Protector Trip Range

Ampere Rating	Adjustable Trip Range	Catalog Number	
		J-Interrupting—600 Vac	L-Interrupting—480 Vac
600 A	1200–10,000 A	PJL36060M68	PLL34060M68
800 A	1200–10,000 A	PJL36080M68	PLL34080M68
1000 A	1500–10,000 A	PJL36100M69	PLL34100M69
1200 A	1800–10,000 A	PJL36120M70	PLL34120M70

NOTE: Continuous currents larger than the ampere rating can damage the motor circuit protector.

Select motor circuit protectors as follows:

1. Determine motor horsepower (hp) rating from the motor nameplate. The selection table is suitable for motors with locked-rotor indicating code letters per NEC Table 430-7 (b) as follows:

Horsepower	Motor Code Letters
30–150	A–G
150 or More	A–F

NOTE: For other motors contact Schneider Electric.

2. Select a motor circuit protector with an ampere rating recommended for the hp and voltage involved.
3. Select an adjustable trip setting of at least 800% but not to exceed 1300% (1700% for high-efficiency motors) of the motor full load amperes (FLA).
4. The NEC 1300% maximum setting (1700% for high-efficiency motors) may be inadequate for motor circuit protectors to withstand current surges typical of the magnetization current of auto-transformer type reduced voltage starters or open transition wye-delta starters during transfer from “start” to “run,” constant hp multi-speed motors and motors labeled “high efficiency.”
5. Part-winding motors, per NEC 430-3, should have two motor circuit protectors selected from the above at not more than one-half the allowable trip setting for the horsepower rating. The two circuit protectors should operate simultaneously as a disconnecting means per NEC 430-103.

56. Catalog numbers for motor circuit protectors are designated by M68, M69, or M70 in positions 11–14 (trip system). See the table below.

PowerPacT P-Frame Electrically-Operated Circuit Breakers

Electrically-operated P-frame circuit breakers are available in I-Line and unit-mount construction up to 1200 A and are denoted in the catalog number by an “M_” suffix. These come equipped with a two-step stored energy mechanism and come standard with a motor assembly. These are available factory-installed only.

Motor assemblies provide on and off control from remote locations. The assemblies contain a spring-charging motor (MCH), a shunt trip (MX) and a shunt close (XF) and are available in standard or communicating versions. An SDE overcurrent trip switch is also included for trip indication. When remote indication of the circuit breaker status is required, use of a circuit breaker with an OF auxiliary switch for on-off indication. See *Indication Contacts*, page 136 for details.

Motors Assembly Voltage Ratings (Vn)

Voltage Type	Voltage Ratings (Vn)
Vac 50/60 Hz	48, 100–130, 220–240, 380–415
Vdc	24–30, 48–60, 110–130, 200–250

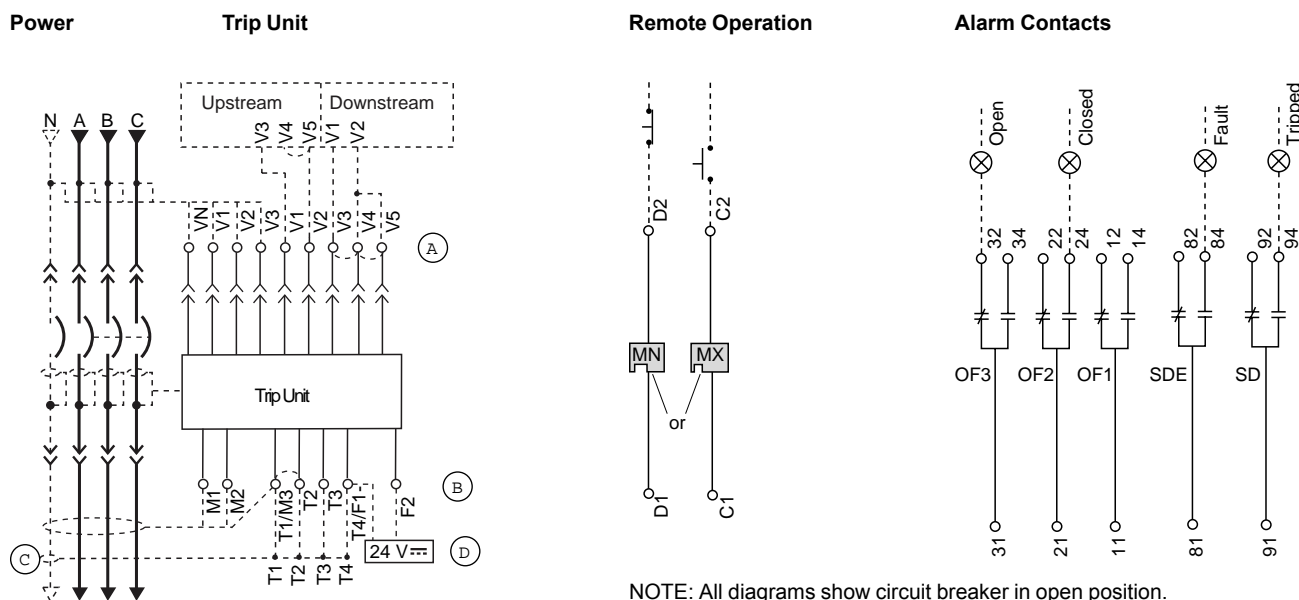

PowerPacT P-Frame Termination Information

Unit-mount circuit breakers and switches have mechanical lugs standard on both ends. I-Line circuit breakers have lugs standard on the O/OFF end. These lugs accept aluminum or copper wire. Manually-operated P-frame circuit breakers are also available in drawout construction. See *Mechanical, Compression, and Distribution Lugs*, page 150 for more lug options.

PowerPacT P-Frame Control Wiring

Control wiring for unit-mount and I-Line construction is connected to terminals located under the circuit breaker accessory cover. Control wiring for drawout construction is connected to terminals located on the cradle.

Accessory Control Wiring Diagrams for Manually-Operated P-Frame Circuit Breakers

A—Do not remove factory-installed jumpers between Z3, Z4 and Z5 unless ZSI is connected.

B—Do not remove factory-installed jumper between T1 and T2 unless neutral CT is connected. Do not install jumper between T3 and T4.

C—For proper wiring of neutral CT, refer to Instruction Bulletin 48041-082-03 shipped with it.

D—24 Vdc power supply for trip unit must be separate and isolated from 24 Vdc power supply for communication modules.

Accessory Control Wiring for Manually-Operated P-Frame Circuit Breaker

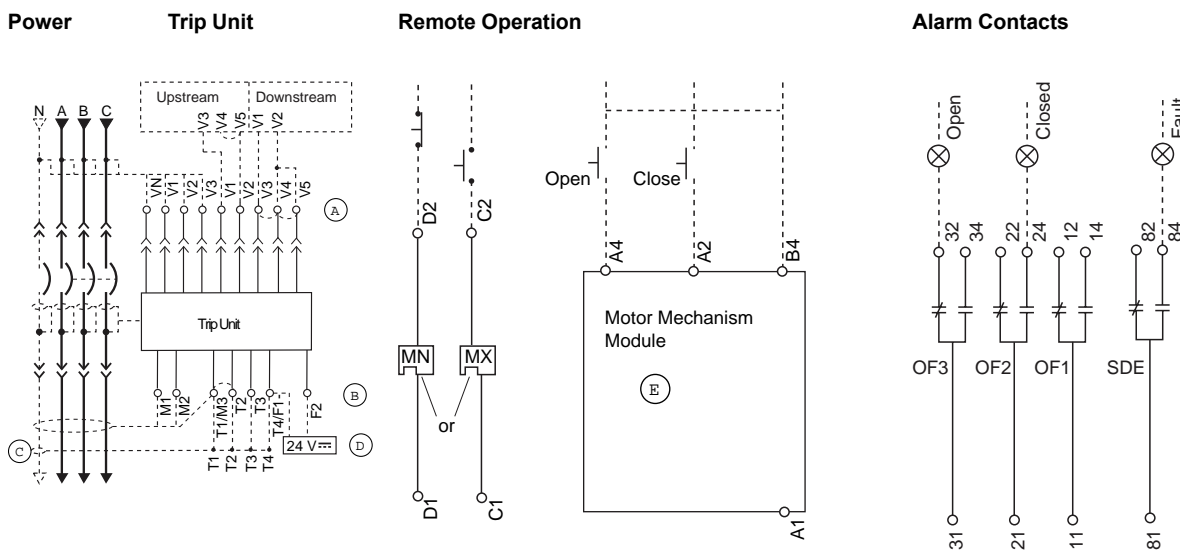

Trip Unit Type					
Basic	A	P	H	Connector	Description

Section 6—PowerPacT R-Frame Molded Case Circuit Breakers

PowerPacT R-Frame Performance

R-Frame Unit-Mount

R-Frame I-Line

Providing unparalleled performance and control, the R-frame circuit breakers features the exclusive MicroLogic electronic trip units, which allow for a range of sophisticated applications for metering and monitoring. In addition, trip units can be interchanged in the field to allow for maximum flexibility.

The compact size and smaller footprint of the R-frame circuit breaker permits higher density installations using I-Line panelboards and switchboards. These circuit breakers are available in 100% rated construction up to 3000 A to meet a broad range of commercial and industrial application needs.

- Both standard and 100% rated construction circuit breakers are available in 3000 A with a sensor size range of 600–3000 A.
- Interrupting ratings (AIR):

Voltage	G	J	K	L
240 Vac	65 kA	100 kA	65 kA	125 kA
480 Vac	35 kA	65 kA	65 kA	100 kA
600 Vac	18 kA	25 kA	65 kA	50 kA

- The K interrupting rating is recommended for applications having high inrush and/or non-linear loads such as large motors, transformers, motors with soft starts, etc.
- ComPacT circuit breaker size allows for smaller footprint installations using I-Line panelboards and switchboards. Fifteen-inch width provides increased density installation.
- Most field-installable accessories are common to all frame sizes for easier stocking and installation
- Selection of four interchangeable MicroLogic trip units available, with PowerLogic power metering and monitoring capabilities available in advanced trip units.
- Compatible with PowerLogic systems and high amperage power circuit breakers.
- Built-in Modbus protocol provides an open communications platform and eliminates the need to purchase additional, proprietary network solutions.
- Connection options include bus, cable or I-Line for installation flexibility.

PowerPacT R-Frame Automatic Molded Case Switches

Automatic molded case switches are available in unit-mount construction from 1200–3000 A. Automatic switches are similar in construction to electronic trip circuit breakers except that long-time protection is not present. The switches open instantaneously at a non-adjustable magnetic trip point calibrated to protect only the molded case switch itself. They must be used in conjunction with a circuit breaker or fuse of equivalent rating.

NOTE: Catalog numbers for automatic switches are designated by “000” in positions 7–9 (ampere rating) and S12, S16, S20, S25, or S30 in positions 11–14 (trip system). See Catalog Number for M-, P- and R-Frame (UL/IEC Dual-Rated) Circuit Breakers, page 18.

Automatic Switch Information

Circuit Breaker	Ampere Rating	Catalog Number ⁷³	Withstand Rating			Trip Point (±10%)
			240 Vac	480 Vac	600 Vac	
RK 2P, 3P	1200	RKF36000S12	65 kA	65 kA	65 kA	57 kA
	1600	RKF36000S16	65 kA	65 kA	65 kA	57 kA
	2000	RKF36000S20	65 kA	65 kA	65 kA	57 kA
	2500	RKF36000S25	65 kA	65 kA	65 kA	57 kA
	3000	RKF36000S30	65 kA	65 kA	65 kA	57 kA
RL 2P, 3P	1200	RLF36000S12	125 kA	100 kA	50 kA	39 kA
	1600	RLF36000S16	125 kA	100 kA	50 kA	39 kA
	2000	RLF36000S20	125 kA	100 kA	50 kA	39 kA
	2500	RLF36000S25	125 kA	100 kA	50 kA	39 kA
	3000	RLF36000S30	125 kA	100 kA	50 kA	39 kA

73. For 2P, replace the leading 3 in the catalog number following the prefix with a 2 (RKP36000S12 becomes RKP26000S12).

PowerPacT R-Frame Termination Information

I-Line circuit breakers have lugs standard on the O/OFF end. Unit-mount circuit breakers and switches are equipped for direct bus connection.

For cable connections, optional terminal pad RLTB or equivalent bus structure is required. RLTB kits are included with 2500 A 100% rated circuit breakers. The RL3TB kits are included with the 3000 A, 80% and 100% rated circuit breakers. For other circuit breakers, order terminal pad kit RLTB and optional lugs separately. Refer to Section 11—PowerPacT M-, P- and R-Frame and ComPacT NS630b–NS3200 Dimensional Drawings, page 167 for terminal pad kit dimensions.

RLTB Terminal Pad Kit

Terminal Pad Kits for R-Frame Circuit Breakers

R-Frame Circuit Breaker	Terminal Pad Kit	Lugs per Phase	Field-Installable Kits	
	Usage		3P (One End Only)	4P (One End Only)
3000 A, 100% Rated	Required for Cable or Bus	9	RL3TB ⁷⁴	RL3TB4
3000 A, Standard (80% Rated)	Required for Cable or Bus	8	RL3TB ⁷⁴	RL3TB4
2500 A, 100% Rated	Required for Cable or Bus	8	RLTB ⁷⁴	RLTB4
2500 A, Standard (80% Rated)	Required for Cable, Optional for Bus	8	RLTB	RLTB4
All Other R-Frame Circuit Breakers	Required for Cable, Optional for Bus	8	RLTB	RLTB4

For cable connection to RLTB, use AL2500RK lug. See Mechanical, Compression, and Distribution Lugs, page 150.

PowerPacT R-Frame Continuous Current Rating

All circuit breakers marked as 100% rated can be continuously loaded to 100% of their rating. 100% rated circuit breakers are available in unit-mount construction up to 3000 A and in I-Line construction up to 1200 A.

Because of the additional heat generated when applying circuit breakers at 100% of continuous current rating, the use of specially-designed enclosures and 194°F (90°C) wire is required. The 194°F (90°C) wire must be sized according to the ampacity of the 167°F (75°C) wire column in the NEC. Minimum enclosure size and ventilation specifications are indicated on a label on the circuit breaker, in the circuit breaker instruction bulletin and in Enclosure Sizes, page 11.

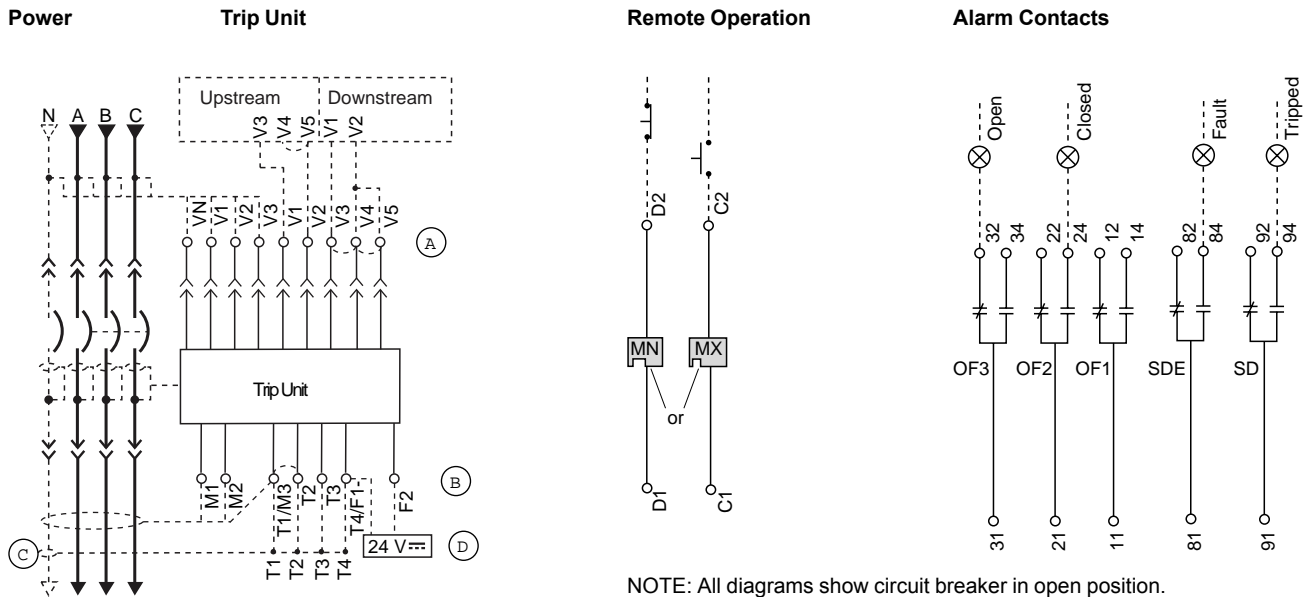

Circuit breakers with 100% rating can also be used in applications requiring only 80% continuous loading.

74. Supplied as standard with the R-frame circuit breaker.

PowerPacT R-Frame Control Wiring

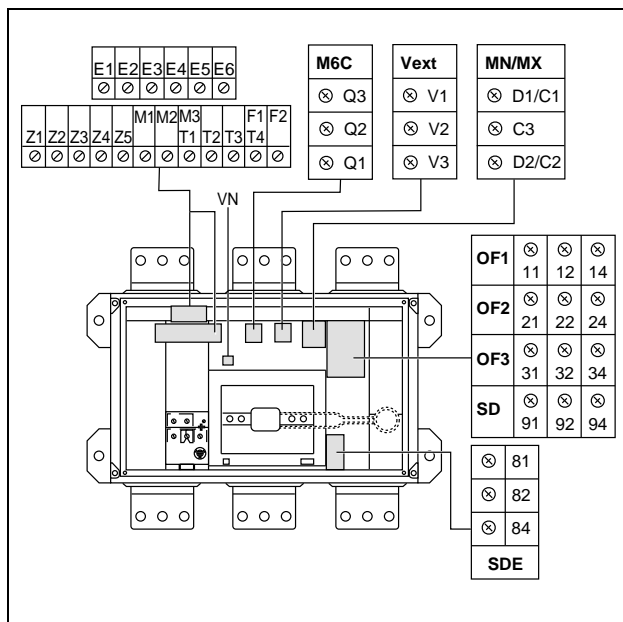

Control wiring is connected to terminals located under the circuit breaker accessory cover.

Accessory Control Wiring Diagrams for R-Frame Circuit Breakers

- A—Do not remove factory-installed jumpers between Z3, Z4 and Z5 unless ZSI is connected.
- B—Do not remove factory-installed jumper between T1 and T2 unless neutral CT is connected. Do not install jumper between T3 and T4.
- C—For proper wiring of neutral CT, refer to Instruction Bulletin 48041-082-03 shipped with it.
- D—24 Vdc power supply for trip unit must be separate and isolated from 24 Vdc power supply for communication modules.

Accessory Wiring for R-Frame Circuit Breaker

Connector ⁷⁵	Recommended Wire Size
V1, V2, V3, Vn	22–16 AWG (0.3–1.5 mm ²)
E1–E2	22 AWG (0.3 mm ²) MIN shielded pair cable or twisted pair copper wires
T	22 AWG (0.3 mm ²) stranded shielded cable
M	Refer to MDGF instructions
E3–E6, Q1, Q2, Q3	22 AWG (0.3 mm ²) shielded twisted pairs with drain (Belden 8723 or equal) ³
OF, SD, SDE	18–16 AWG (0.8–1.5 mm ²)
MN, MX	18–14 AWG (0.8–2.5 mm ²)
F	Size per aux 24 Vdc power supply
Z1–Z5	22–18 AWG (0.3–0.8 mm ²)

Trip Unit Type

—	•	•	•	M	Modified differential ground fault (MDGF)
—	•	•	•	F	24 Vdc external power supply
—	—	•	•	Vn ⁷⁶	External neutral voltage takeoff
—	—	•	•	V1, V2, V3	External phase voltage takeoff
—	—	•	•	M6C ⁷⁷ : Q1, Q2, Q3	6 programmable contacts 24 Vdc external power supply required
Function		Connector		Description	
Auxiliary Contacts		OF		Open/Closed circuit breaker or switch position contacts	
		SD		Bell alarm	
		SDE		Electrical fault alarm contact	
Remote Operation		MN		Undervoltage trip device	
		MX		Shunt trip	

75. C3 terminal is not used.
 76. Neutral voltage takeoff supplied as flying lead.
 77. Optional M6C programmable contacts are supplied with flying leads.

Section 7—ComPacT NS630b–NS1600 Circuit Breakers

ComPacT NS630b–NS1600 Performance

ComPacT NS630b–NS1600

The ComPacT NS630b–NS1600 circuit breakers feature the exclusive MicroLogic electronic trip units, which allow for a range of sophisticated applications for metering and monitoring. In addition, trip units can be interchanged in the field to allow for maximum flexibility.

The compact size and small footprint of the NS circuit breakers permit higher density installations. These circuit breakers are available in ratings up to 1600 A to meet a broad range of commercial and industrial application needs.

- Circuit breakers are available in 1600 A construction with a sensor size range of 250–1600 A.
- Interrupting ratings (AIR):

Circuit Breaker	Interrupting Rating	220/240 Vac		380/415 Vac		440 Vac		500/525 Vac		660/690 Vac	
		Icu	Ics	Icu	Ics	Icu	Ics	Icu	Ics	Icu	Ics
Electrically Operated											
NS630b–NS1600	N	50 kA	37 kA	50 kA	37 kA	50 kA	37 kA	40 kA	30 kA	30 kA	22 kA

- ComPacT circuit breaker size allows for smaller footprint installations. Nine inch width provides increased density installation.
- Most field-installable accessories are common to all frame sizes for easier stocking and installation.
- Selection of four interchangeable MicroLogic trip units available, with PowerLogic power metering and monitoring capabilities available in advanced trip units.
- Compatible with PowerLogic systems and high amperage power circuit breakers.
- Built-in Modbus protocol provides an open communications platform and eliminates the need to purchase additional, proprietary network solutions.
- Connection options include bus or cable for installation flexibility.
- Additional options are available for five-cycle closing, stored energy mechanisms and drawout-mounting.

ComPacT NS630b–NS1600 Drawout Configuration

Drawout ComPacT NS800H.

The drawout configuration makes it possible to:

- extract and/or rapidly replace the circuit breaker without having to touch connectors
- allow for the addition of circuits at a later date

ComPacT NS630b to NS1600 circuit breakers should be installed vertically only.

Mounting on a backplate.

Rear mounting on rails.

Device on mounting plate.

Device on rails.

ComPacT NS630b-NS1600 Interrupting Ratings

See PowerPacT P-Frame Interrupting Ratings, page 101.

ComPacT NS630b-NS1600 Electrically-Operated Circuit Breakers

Electrically-operated NS630b–NS1600 circuit breakers are available in unit-mount construction up to 1600 A and are denoted in the catalog number by an “M_” suffix. These come equipped with a two-step stored energy mechanism and come standard with a motor assembly.

Motor assemblies provide on and off control from remote locations. The assemblies contain a spring-charging motor (MCH), a shunt trip (MX) and a shunt close (XF) and are available in standard or communicating versions. An SDE overcurrent trip switch is also included for trip indication. When remote indication of the circuit breaker status is required, use of a circuit breaker with an OF auxiliary switch (for on-off indication).

Motor Assembly Voltage Ratings (Vn)

Voltage Type	Voltage Ratings (Vn)
Vac 50/60 Hz	48, 100–130, 220–240, 380–415
Vdc	24–30, 48–60, 100–130, 200–250

For catalog numbers, see Spring-Charging Motors (MCH) for P-Frame Circuit Breakers, page 137.

ComPacT NS630b-NS1600 Termination Information

Unit-mount circuit breakers and switches have mechanical lugs standard on both ends. These lugs accept aluminum or copper wire. Manually operated circuit breakers are also available in drawout construction.

Other terminations are available as accessories for non-standard applications. See Mechanical, Compression, and Distribution Lugs, page 150 for more lug options.

83. Installation standards require upstream protection.

84. Not available on 1600 A circuit breaker with “L” termination.

ComPacT NS630b-NS1600 Accessories

Accessories are available either factory-installed or field-installable. They can be installed in accessory compartments behind the circuit breaker accessory cover. See M-frame, P-frame, R-frame and NS630b–NS3200 Accessory Availability, page 130 for available accessories.

ComPacT NS630b-NS1600 Control Wiring

Control wiring is connected to terminals located under the circuit breaker accessory cover.

Accessory Control Wiring Diagrams for Manually-Operated Circuit Breakers

See Accessory Control Wiring Diagrams for Electrically-Operated P-Frame Circuit Breakers, page 107. (Same as PowerPacT P-frame circuit breaker.)

Accessory Control Wiring Diagrams for Electrically-Operated Circuit Breakers

See Accessory Control Wiring Diagrams for Electrically-Operated P-Frame Circuit Breakers, page 107. (Same as PowerPacT P-frame circuit breaker.)

Section 8—ComPacT NS1600b–NS3200 Circuit Breaker

ComPacT NS1600b–NS3200 Performance

ComPacT NS1600b–NS3200

The ComPacT NS1600b–NS3200 circuit breakers feature the exclusive MicroLogic electronic trip units, which allow for a range of sophisticated applications for metering and monitoring. In addition, trip units can be interchanged in the field to allow for maximum flexibility.

The compact size and smaller footprint of the NS circuit breaker permits higher density installations. These circuit breakers are available in up to 3200 A construction to meet a broad range of commercial and industrial application needs.

- Circuit breakers are available in 3200 A construction with a sensor size range of 600–3200 A.
- Interrupting ratings (AIR):

Interrupting Rating	220/240 Vac		380/415 Vac		440 Vac		500/525 Vac		660/690 Vac	
	Icu	Ics	Icu	Ics	Icu	Ics	Icu	Ics	Icu	Ics
N	85 kA	65 kA	70 kA	52 kA	65 kA	65 kA	65 kA	65 kA	65 kA	65 kA
H	125 kA	94 kA	85 kA	64 kA	85 kA	64 kA	—	—	—	—

- The N interrupting rating is recommended for applications having high inrush and/or non-linear loads such as large motors, transformers, motors with soft starts, etc.
- ComPacT circuit breaker size allows for smaller footprint installations. Fifteen-inch width provides increased density installation.
- Most field-installable accessories are common to all frame sizes for easier stocking and installation.
- Selection of four interchangeable MicroLogic trip units available, with PowerLogic power metering and monitoring capabilities available in advanced trip units.
- Compatible with PowerLogic systems and high amperage power circuit breakers.
- Built-in Modbus protocol provides an open communications platform and eliminates the need to purchase additional, proprietary network solutions.
- Connection options include bus or cable for installation flexibility.

ComPacT NS1600b–NS3200 Termination Information

NS1600b–NS3200 circuit breakers are equipped for bus connection only. For certain amperages, an RLTBE terminal pad kit may be required. (Same kit as the PowerPacT R-frame circuit breaker.) Refer to PowerPacT R-Frame Termination Information, page 117 for terminal pad kit information.

Terminal Pad Kits for ComPacT NS1600b–NS3200 Circuit Breakers

Circuit Breaker	Terminal Pad Kit (One End Only)		
	Usage	3P Kit	4P Kit
3200 A	Required	Provided	Provided
All Other Circuit Breakers	Optional	RLTBE	RLTBE4

ComPacT NS1600b–NS3200 Accessories

Accessories are available either factory-installed or field-installable. They can be installed in accessory compartments behind the circuit breaker accessory cover. (Same accessories as the R-frame circuit breaker.)

ComPacT NS1600b–NS3200 Control Wiring

Control wiring is connected to terminals located under the circuit breaker accessory cover.

Refer to Wiring Diagrams PowerPacT R-Frame Control Wiring, page 118. (Same as the R-frame circuit breaker.)

85. For 4P, replace the leading 3 in the catalog number following the prefix with a 4 (NRHFE36200U74RE1 becomes NRHFE46200U74RE1).

86. Add E1 suffix for Modbus Communications.

Section 9—PowerPacT M-, P-, and R-Frame, and ComPacT NS630b–NS3200 Accessories

M-frame, P-frame, R-frame and NS630b–NS3200 Accessories

M-frame, P-frame, R-frame and NS630b–NS3200 circuit breakers can be used with a variety of internal and external accessories to increase application versatility and meet the demands of modern electrical distribution systems.

Circuit breaker internal accessories are available either factory installed or field installable. They can be installed in accessory compartments behind the circuit breaker accessory cover.

M-frame, P-frame, R-frame and NS630b–NS3200 Factory-Installed Accessories

Factory-installed accessories are internally mounted by the factory. Accessories only available factory installed cannot be removed or repaired in the field. Order factory-installed accessories by adding the correct two-letter suffix to the standard circuit breaker catalog number. To build a catalog number, refer to the product selector or contact a field office.

M-frame, P-frame, R-frame and NS630b–NS3200 Field-Installable Accessories

Field-installable accessories can be installed or replaced in the field without affecting the circuit breaker ratings. Field-installable accessories are shipped separately from the circuit breakers. Install and wire field-installable accessories according to the instructions supplied with the circuit breaker and particular accessory. Order field-installable accessories by the catalog number found in the *Schneider Electric Digest*.

Electrical Accessories

Maximum Wire Length

Maximum Wire Length—The inrush currents for these devices are approximately 200 VA. When low supply voltages (12, 24 or 48 V) are used, the maximum allowable wire length is dependent on the voltage and the wire size.

Device	Percent of Source Voltage	Source Voltage					
		12 Vdc		24 Vdc		48 Vdc	
Wire Size		14 AWG (2.08 mm ²)	16 AWG (1.31 mm ²)	14 AWG (2.08 mm ²)	16 AWG (1.31 mm ²)	14 AWG (2.08 mm ²)	16 AWG (1.31 mm ²)
UVR (MN) ⁸⁷	100%	—	—	159 ft (48.5 m)	100 ft (30.5 m)	765 ft (233.2 m)	472 ft (143.9 m)
	85%	—	—	44 ft (13.4 m)	29 ft (8.8 m)	205 ft (62.5 m)	129 ft (39.3 m)
Shunt Trip (MX) and Shunt Close (XF) ⁸⁷	100%	57 ft (17.4 m)	34 ft (10.4 m)	314 ft (95.7 m)	200 ft (61.0 m)	1503 ft (457.8 m)	944 ft (287.7 m)
	85%	27 ft (8.2 m)	17 ft (5.2 m)	205 ft (62.5 m)	126 ft (38.4 m)	957 ft (291.7 m)	601 ft (183.2 m)

Shunt Trip (MX1) and Shunt Close (XF)

Shunt Trip (MX1): When energized, the shunt trip instantaneously opens the circuit breaker. The shunt trip may be energized continuously or intermittently.

Shunt Close (XF): Remotely closes the circuit breaker if the spring mechanism is charged. The shunt close may be energized continuously or intermittently. This accessory is for electrically-operated P-frame circuit breaker only.

Communication versions of the MX1 and XF are available for direct connection via the circuit breaker communication module (BCM).

Characteristics		MX1	XF	Min	Max
Voltage Ratings (V_n)	Vac 50/60 Hz	24 Vac		17 Vac	26 Vac
		48 Vac		34 Vac	52 Vac
		120 Vac		60 Vac	132 Vac
		240 Vac		168 Vac	264 Vac
		277 Vac		194 Vac	304 Vac
		380 Vac		266 Vac	418 Vac
	Vdc	12 Vdc		8 Vdc	13 Vdc
		24 Vdc		17 Vdc	26 Vdc
		48 Vdc		34 Vdc	52 Vdc
		125 Vdc		88 Vdc	137 Vdc
250 Vdc		175 Vdc	275 Vdc		
Operating Threshold		0.7 to 1.1 V_n	0.85 to 1.1 V_n		
Power Consumption (VA or W)	Steady-State/ Inrush	4.5/200			
Circuit Breaker Response Time at V_n ⁸⁸		50 ms \pm 10	70 ms \pm 10 (NW \leq 4000 A)		

87. The length shown in the table is for each of the two supply wires.

88. Shunt trip (MX1) and shunt close (XF) circuits must be energized for minimum of 200 ms.

Characteristics	MX1	XF	Min	Max
		80 ms ±10 (NW > 4000 A)		
		55 ms (NT)		

Undervoltage Trip (MN)

Undervoltage Trip (MN)

This function opens the circuit breaker via an electrical order.

It is made up of:

- Instantaneous trip
- Fixed undervoltage trip (time delayed) or,
- Adjustable undervoltage trip (time delayed)

As shown in the wiring diagram for the remote tripping function below, the delay unit (installed outside the circuit breaker) may be disabled by an emergency off button to obtain non-delayed opening of the circuit breaker.

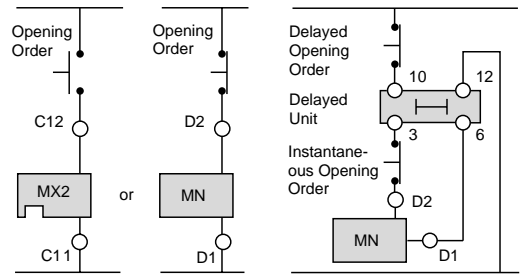

The undervoltage trip (MN) instantaneously opens the circuit breaker when its supply voltage drops to a value between 35% and 70% of its rated voltage.

If the undervoltage trip is not energized, it is impossible to close the circuit breaker, either manually or electrically. An attempt to close the circuit breaker produces no movement of the main contacts. Closing is allowed when the supply voltage of the undervoltage trip reaches 85% of rated voltage.

Undervoltage Trip Characteristics

Characteristics		MN
Voltage Ratings (V_n)	Vac 50/60 Hz	24 Vac
		48 Vac
		120 Vac
		240 Vac
		277 Vac
		380 Vac
		480 Vac
	Vdc	12 Vdc
		24 Vdc
		48 Vdc
		125 Vdc
		250 Vdc
Power Consumption (VA or W)	Constant/Inrush	4.5/200
Operating Threshold	Opening	0.35 to 0.70 V_n
	Closing	0.35 V_n
Circuit Breaker Response Time at V_n		90 ms ±5

Wiring Diagram for the Remote Tripping Function

Time-Delay Module for Undervoltage Trip

To eliminate circuit breaker nuisance tripping during temporary voltage dips (micro-breaks), operation of the undervoltage trip (MN) can be delayed by adding an external time-delay module to the undervoltage trip circuit. Available as adjustable and non-adjustable module.

Time-Delay Module Characteristics

Characteristics				Factory-Installed Cat. No. Suffix	Field-Installable Cat. No.
Voltage Ratings of Time-delay Module	Adjustable	Vac 50/60 Hz / Vdc	48-60	—	S33680
			100-130	—	S33681
			200-250	—	S33682
			380-480	—	S33683
	Non-Adjustable	Vac 50/60 Hz / Vdc	100-130	—	S33684
			200-250	—	S33685
Operating Threshold		Opening	0.35 to 0.7 V _n		
		Closing	0.85 V _n		
Power Consumption			4.5 VA/W (holding), 200 VA/W (inrush)		
Time-Delay Settings	Adjustable		0.5, 0.9, 1.5, and 3.0 s		
	Non-Adjustable		0.25 s		

Indication Contacts

Changeover contacts are used to provide remote circuit breaker status information and can be used for indications, electrical locking, relaying, etc. All the auxiliary contacts are also available in “low-level” versions capable of switching very low loads (for the control of PLCs or electronic circuits).

Auxiliary Switch (OF):

- remotely indicates the position of the main circuit breaker contacts.
- can be used to operate indicator lights, relays or other accessories.
- circuit breaker can accommodate up to three 1A/1B auxiliary switches.

Alarm Switch (SD)

- indicates that the circuit breaker has tripped due to:
 - an overload
 - a short circuit
 - an earth-leakage fault
 - operation of a voltage release
 - operation of the “push-to-trip” button
- Returns to de-energized state when the circuit breaker is reset.

Overcurrent Trip Switch (SDE)

- indicates that the circuit breaker has tripped due to:
 - an overload
 - a short circuit
 - an earth-leakage fault
- Returns to de-energized state when the circuit breaker is reset.

Electrical Characteristics of the OF/SD/SDE Auxiliary Contacts

Contacts		Standard		Low Level ⁸⁹	
Rated thermal current (A)		6		5	
Minimum load		100 mA at 24 V		1 mA at 24 V	
Operational current (A)	Voltage	AC	DC	AC	DC
	24 V	6	6	5	5
	48 V	6	2.5	5	2.5
	110 V	6	0.6	5	0.6
	220/240 V	6	—	5	—
	250 V	—	0.3	5	0.3
	380/440 V	6	—	5	—
	480 V	6	—	5	—
	660/690 V	6	—	—	—

NOTE: If the maximum voltage and current is exceeded, the low-level functions of the switch will be lost but the switch will continue to function as a standard switch.

89. SDE is not available in low level for electrically-operated P-frame circuit breakers.

Spring-Charging Motors (MCH) for P-Frame Circuit Breakers

The spring-charging motor automatically charges the spring mechanism for closing the circuit breaker and also recharges the spring mechanism when the circuit breaker is in the ON position. Instantaneous reclosing of the circuit breaker is thus possible following circuit breaker opening. The spring-mechanism charging handle is used only as a backup if auxiliary power is absent.

The spring-charging motor is equipped as standard with a limit switch contact (CH) that signals the charged position of the mechanism (springs charged).

Spring-Charging Motor Characteristics

Characteristics		MCH
Voltage Ratings (V _n)	Vac 50/60 Hz	48-60, 100-130, 200-250, 240-277, 380-415, 400-440, 480
	Vdc	24-30, 48-60, 100-125, 200-250
Operating Threshold		0.85 to 1.1 V _n
Power Consumption		180 VA
Motor Overcurrent		2–3 x I _n for 0.1 s
Charging Time		4 s maximum on NW, 3 s maximum on NT
Duty Cycle		3 cycles per minute maximum
Endurance		10,000 cycles for NW < 4000 A 5000 cycles for NW ≥ 4000 A
CH Contact		10 A at 240 V

90. Not available on an electrically-operated P-frame circuit breaker.

MicroLogic Trip Unit Accessories

Circuit breakers are shipped with trip unit installed, but can have the trip units replaced in the field. Actual trip units and settings required for specific applications must be determined by a qualified consultant or plant engineer. A coordination study is recommended to provide coordination between all circuit breakers in the distribution system.

Field-Installable MicroLogic Trip Unit

Model	Protection	Additional Features	Field-Installable Cat. No. ⁹¹

Lead-Free Trip Unit Sealing Kit

The MICROTUSEAL lead-free trip unit seal was designed as a RoHS-compliant replacement for lead seals. It may be used to seal MicroLogic trip units and other devices. It is manufactured as a stainless steel cable and polycarbonate locking mechanism which shows evidence of tampering. The seal is individually numbered for control purposes.

Order kit number MICROTUSEAL

Replacement Covers

Device	Cat. No.
MicroLogic A Trip Unit Cover, clear	S33592
MicroLogic P/H Trip Unit Cover, opaque gray	S47067

91. The standard rating plug supplied with a trip unit is the "A" rating plug. To specify an alternative adjustable rating plug, please add the letter designation to the end of the catalog number. Please refer to the Digest for a complete listing of adjustable settings available with each plug. (Example: S143B would specify a "B" rating plug instead of the standard "A" plug.) Use suffix "N" if no rating plug is required.

When replacing a Basic trip unit with Type A (Ammeter), P (Power metering) or H (Harmonic analysis) trip unit, order the 12-pin connector kit S33101 for the PowerPacT P-frame drawout circuit breakers or kit S33100 for PowerPacT P-frame unit-mount and R-frame circuit breakers.

92. Requires Circuit Breaker Communications Module.

Neutral Current Transformer (CT)

Current transformers are available for applications requiring ground-fault protection on three-phase, four-wire systems or for neutral protection and metering. Neutral current transformers are not required on non-ground-fault circuit breakers, or on three-phase, three-wire systems. The rating of the external neutral current transformer must be compatible with the rating of the circuit breaker.

Circuit Breaker	Sensor	Cat. No.
P-Frame	250	S33575
	400–1600	S33576
R-Frame	250	S48916
	400–1600	S34036
	2000	S48896
	2500	S48182
All	All	NCTWIRING ⁹³
12-pin Trip Unit Connector		S33100

NOTE: These neutral current transformers cannot be used for SGR (Source Ground-Return) or MDGF (Modified Differential Ground Fault) applications.

Ground-Fault Interface Module

The ground-fault interface module (P-frame, R-frame and NS630b–NS3200 circuit breakers only) is used to sum the current flow in three-phase, four-wire systems and multiple-sourced systems, using one or more specially-designed external current sensors to measure current flow. The ground-fault interface module is commonly used in two applications:

- For a ground-source return ground-fault sensing (SGR) system
- For a modified differential ground-fault (MDGF) system

More complex systems are possible, for information about these, contact a field sales representative.

Order kit number S48891.

External Sensor for SGR or MDGF Protections

For use on 400 A sensor or higher.

In SGR applications, an external sensor is installed around the connection of the transformer neutral point to ground. Its secondary is connected to the MicroLogic 6.0A, 6.0P or 6.0H trip units.

In MDGF applications, a sensor is installed on each phase and neutral conductor. The sensors for each circuit breaker are connected to an interface module. These, in turn, connect to the MicroLogic 6.0A, 6.0P or 6.0H trip units.

Order kit number S33579.

93. Included with NCT.

Sensor Plugs

Sensor plugs are used to set the current rating (I_n) of the PowerPacT P- and R-frame circuit breakers.

Beginning in January 2007 (date code 07011), the sensor plugs are field-replaceable, down to 50% of the original rating. Mechanical keying in the circuit breaker prevents changing a rating plug to a higher rating than the original factory-installed sensor plug.

94. Standard.

Modbus Circuit Breaker Communication Module (BCM-ULP)

The circuit breaker communication module is independent of the trip unit. Installed on the circuit breaker, behind the trip unit, it receives and transmits information on the communication network. An optical link is used for communication with the MicroLogic A, P, and H trip units. Power requirements are 30 mA, 24 Vdc.

NOTE: The power supply for the circuit breaker communication module must be separate and isolated from the power supply for the trip unit.

The following may be connected to this module:

- A set of dedicated switches which read the status of the circuit breaker
- A set of “actuators” (MX shunt trip or motor mechanism) to control the circuit breaker

M2C Programmable Contacts

The M2C contacts are used with the MicroLogic P and H control units, and indicate the type of fault and instantaneous or delayed threshold overruns (i.e: trip unit protection pickup, current/voltage unbalance, under/over voltage, reverse power, phase rotation, under/over frequency, and load shedding). The M2C has two programmable contacts while the M6C has six. They require an external 24 Vdc power supply (100 mA consumption).

NOTE: The M2C uses the same 24 V power supply as the trip unit. The M2C and trip unit power supply must be separate and isolated from the power supply used for the BCM. They may be programmed:

- With instantaneous return to the initial state
- Without return to the initial state
- With return to the initial state following a delay

	250 Vdc	0.15 A

Zone-Selective Interlocking (ZSI)

ZSI is used to reduce the stress on electrical distribution equipment during fault conditions by reducing the time it takes to clear the fault, while maintaining system coordination between overcurrent protective devices.

During a short-circuit or ground-fault condition on a ZSI system, the device directly ahead of the fault sends a signal upstream via control wiring to restrain upstream circuit breakers from tripping and then trips with no intentional time delay to clear the fault. Upstream devices which receive a restraint signal obey their short-time and/or ground-fault delay settings to maintain coordination in other areas of the system. Upstream devices that do not receive a restraint signal trip with no intentional time delay.

- Fault 1—The upstream circuit breaker (A) will clear the fault with no intentional delay, regardless of its time-delay setting.
- Fault 2—Circuit breaker (B) will inform upstream circuit breaker (A) that it is clearing the fault. This will prevent circuit breaker (A) from tripping instantaneously. Circuit breaker (A) will trip at the end of its time delay setting if the fault is not cleared during this time.

ZSI requires trip settings be coordinated so a downstream circuit breaker will trip before an upstream circuit breaker under overload, short-circuit or ground-fault conditions. Effective coordination requires a system coordination study. See data bulletin 0100DB0501, *Short Circuit Coordination for Low-Voltage Circuit Breakers*.

Restraint Interface Module (RIM)

The restraint interface module (RIM) is used to allow zone-selective interlocking communications between circuit breakers with old MicroLogic, Merlin Gerin™, or Federal Pioneer trip units and GC series ground-fault relays. For 120 Vac/24 Vdc systems, use catalog number S48890. For 240 Vac / 24 Vdc systems, use catalog number S48895.

Downstream circuit breakers with MicroLogic 2.0A, 5.0A, 5.0P, 5.0H, 6.0A, 6.0P, and 6.0H trip units can restrain up to fifteen upstream circuit breakers with MicroLogic 5.0A, 5.0P, 5.0H, 6.0A, 6.0P, and 6.0H trip units without requiring a restraint interface module. If the number of upstream circuit breakers exceeds fifteen, then a RIM is required.

RIM Requirements

Downstream Device (Sends output to RIM)	Upstream Device (Receives input from RIM) ⁹⁵					
	MicroLogic Trip Unit ⁹⁶	MicroLogic Series B Trip Unit	Square D GC-100 Relay	Square D GC-200 Relay	Merlin Gerin STR58 Trip Unit	Federal Pioneer USRC / USRCM Trip Unit
MicroLogic Trip Unit ⁹⁶	15	R	R	15	15	R
Square D MicroLogic Series B Trip Units	R	26	R	R	R	15
Square D GC-100 Relay	R	R	7	R	R	R
Square D GC-200 Relay	15	R	R	15	15	R
Merlin Gerin STR58 Trip Units	15	R	R	15	15	R
Merlin Gerin STR53 Trip Units	15	R	R	15	15	R
Federal Pioneer USRC / USRCM Trip Units	R	15	R	R	R	15
Square D Add-on Ground Fault Module for Equipment Protection	R	5	R	R	R	R

External Power Supply Module

When used with the MicroLogic A, P, and H trip units, a power supply module makes it possible to:

- Display currents less than 20% of sensor (I_n).
- Maintain display of tripping causes after opening of the circuit breaker.
- Store the value of the interrupted current (P and H trip units only).
- The modules are not UL Listed.

External Power Supply Module

Power Supply Input (+10%, -15%)	Output Voltage	Output Power	Cat. No.
24–30 Vdc Input	24 Vdc	5 VA / 5 W (Ripple < 5%)	685823
48/60 Vdc Input			685824
125 Vdc Input			685825
110–130 Vac Input			685826
200–240 Vac Input			685827
380–415 Vac Input			685829

95. **R** = RIM is required. Number denotes maximum number of upstream circuit breakers that can be restrained without requiring a RIM.

96. Includes 2.0A (as a downstream trip unit only), 5.0A, 5.0P, 5.0H, 6.0A, 6.0P, and 6.0H trip units.

External Battery Backup Module

The external battery backup module (Catalog No. 685831) provides up to twelve hours of backup power for the power supply module.

MicroLogic Trip Unit Test Equipment

Hand-Held Test Kit

The hand held test kit may be used to:

- Verify trip unit operation, the mechanical operation of the circuit breaker, and the electrical continuity of the connection between the tripping coil and the trip unit.
- Supply control power to the trip unit for settings via the keypad when the circuit breaker is open (MicroLogic P and H trip units).
- Inhibit thermal imaging for primary injection test (for MicroLogic types A, P or H).
- Inhibit ground fault for primary injection test (for MicroLogic types A, P or H).
- Self-restrain Zone-Selective Interlocking (ZSI) (for MicroLogic types A, P or H).

Hand-held Test Kit Catalog Numbers

Device	Cat. No.
Hand-held Test Kit	S33594
Seven-pin Test Cable (for Connection Between Test Kit and Trip Unit) ⁹⁷	S48907
Two-pin Test Cable (for Connection Between Test Kit and Trip Unit)	S48908

97. Included in the test kit. Kit for replacement only.

Full-Function Test Kit

The full-function test kit consists of a signal-injection box which can be used alone or with a supporting personal computer (PC). The optional test kit software is compatible with Windows® 95, 98 and Windows NT® operating systems.

The test kit **without** a supporting PC may be used to check:

- The mechanical operation of the circuit breaker
- The electrical continuity of the connection between the tripping coil and the trip unit
- Trip unit operation — for example:
 - Display of settings
 - Operating tests on the electronic component
 - Automatic and manual tests on protection functions (trip curve verification)
 - Tests on the Zone-Selective Interlocking (ZSI) function
 - Inhibition of the ground-fault protection for equipment
 - Inhibition of the thermal imaging
- Save test data into test kit

The test kit **with** a supporting PC may be used to:

- Print test data
- Compare the real tripping curve with the curves available on the PC

230 Vac Filtered Power Cord ⁹⁸	S48856
120 Vac Filtered Power Cord ⁹⁸	S48855

⁹⁸. Included in the test kit. Kit for replacement only.

Circuit Breaker Terminations

Mechanical, Compression, and Distribution Lugs

The M-frame, P-frame and NS630b–NS1250 circuit breakers have mechanical lugs standard on both ends of the unit-mounted circuit breakers. The M-frame and P-frame I-Line circuit breakers have mechanical lugs standard on the O/OFF end only. These lugs are suitable for use with copper or aluminum wire. Rear connectors, compression lugs and distribution lugs are available for special applications.

M-Frame Mechanical Lugs

P-Frame Mechanical Lugs

M-Frame Compression Lug

R-Frame Compression Lug

P-frame and NS630b–NS1600 circuit breakers are also available in drawout construction. See Section 8 for drawout cradle details.

The R-frame and NS1600b–NS3200 circuit breakers have terminal pads only (no lugs) for bus connections on both ends. Terminal pads are required for the use of lugs on R-frame circuit breakers, lugs are not available for NS1600b–NS3200 circuit breakers. See the section on R-frame and NS1600b–NS3200 circuit breakers for information on terminal pad requirements. R-frame I-Line circuit breakers have mechanical lugs standard on the O/OFF end only (AL1200R53K).

Copper mechanical lugs are available for use with copper wire only. These lugs can be factory installed by adding an LC suffix to the circuit breaker catalog number for standard copper lugs and LD suffix for high-amp copper lugs (M-frame, P-frame and NS630b–NS1250 ≤ 800 A circuit breakers only). See the Digest or product selector or contact the field office for more information.

I-Line Jaw Configurations

Standard 3P I-Line circuit breakers are supplied with an ABC phase jaw connection. In applications where the jaw configuration must be reversed, specify a CBA jaw configuration by adding the digit 6 to the phasing position of the circuit breaker catalog number.

I-Line 2P circuit breakers are available in AC or CA phasing. Add the digit of the desired phasing to the phasing position of the circuit breaker catalog number.

I-Line Phase Options

Phase Option Number	Phase Connections
1	AB
2	AC
3	BA
4	BC
5	CA
6	CB
Standard	ABC
6	CBA ⁹⁹

99. PowerPacT M is not available with CBA termination option.

Power Distribution Connectors

PDC6P20 PDC12P4

Power distribution connectors (PDCs) are available for M-frame, P-frame and NS630b–NS1250 unit-mount circuit breakers as field-installable kits. They can be used for multiple load wire connections on one circuit breaker. Each is UL Listed for copper wire only. Power distribution connectors are for use on the O/OFF end of the circuit breaker only, and the O/OFF end must be connected to the load. PDCs are for use in UL508 applications only.

Control Wire Terminations

Mechanical lug kits are available with provisions for control wire terminations. The control wire is crimped to a standard ring-type wire crimp terminal (not included) and secured to the lug using the #6–32 screw included in the kit. These lugs are UL and CSA Recognized as a circuit breaker component.

These lugs are available factory installed or as field-installable kits. For factory-installed control wire terminations, add the suffix from the table below in the lug option field of the catalog number.

Control Wire Termination

Termination Code	Control Wire Location	Control Wire Suffix
L	Both ends	LW
M	ON end only	LU
P	OFF end only	LV

104. For 4P circuit breakers, add "4" to kit catalog number (AL800M23K4 instead of AL800M23K).

105. Not available with tapped hole for control wire.

MPR External Accessories

Phase Barriers

Phase barriers are available for M-frame, P-frame and NS630b–NS1600 unit-mount circuit breakers with bus connections or with lugs \leq 800 A. Phase barriers are also available for R-frame and NS1600b–NS3200 unit-mount circuit breakers.

Used With	Cat. No.	Qty Per Kit
M-Frame and P-Frame	S33646	3
R-Frame	S33998	

Electric Joint Compound

I-Line circuit breakers, I-Line busway plug-on units and I-Line panelboards and switchboards are supplied with factory-applied joint compound on the plug-on connectors. The compound is especially formulated for I-Line connections and contributes to the overall performance of the connection.

If the joint compound is removed, it must be reapplied. A two-ounce container of the compound (Cat. No. PJC7201) is available.

Door-Mounted Operating Mechanisms

Door-mounted operating mechanisms are available for M- and P-frame circuit breakers. The Type L door-mounted variable-depth operating mechanism feature heavy-duty, all-metal constructions. They can be padlocked in the OFF position when the enclosure door is open. Handle assemblies can be locked OFF with up to three padlocks, which also locks the door closed. Complete kits include a handle assembly, operating mechanism, and shaft assembly, and are rated for NEMA Type 1, 3R and 12 enclosures. A door drilling template is supplied for ease of installation.

Operating Mechanism

Handle Assembly

Door-Mounted Operating Mechanisms

Description		Handle Assembly ¹⁰⁶	Shaft Mounting Depth	Cat. No.
Circuit Breaker Mechanism	Type L	Painted, 8 inch	7.2–11.625 in. (182–295 mm)	9421LW1

	Long Shaft	—	7.2–22.25 in. (182–565 mm)	9421LS10

106. Painted handles are painted flat black, with the base ring silver.

107. Due to gasketing, NEMA 3 and 4 handle assemblies are NOT trip indicating.

Handle Extension

Handle extensions are available for M- and P-frame circuit breakers. Order catalog number 33195.

Rotary Operating Handles

P-frame and NS630b–NS1600 circuit breakers are available with standard black directly-mounted (IP-40) or door-mounted / telescopic door-mounted (IP-55) rotary handles. The rotary handles are factory-installed and available with two early-break or two early-make contacts.

Replacement Handles for M-, P-, and R-Frame Circuit Breakers

Device	Switches	Factory-Installed Cat. No. Suffix
Direct Mounted, Standard Black Handle	—	RD10
	Two Early-Break and Two Early-Make Switches	RD16
Door Mounted, Standard Black Handle	—	RE10
	Two Early-Break and Two Early-Make Switches	RE16
Rotary Handle Replacement Kit	—	S33875

Replacement Handles

Replacement handle assemblies are available for R-frame and NS1600b–NS3200 circuit breakers.

Replacement toggle handle extensions, including an optional longer handle extension, are available for M-frame, P-frame, and NS630b–NS1600 circuit breakers.

Replacement Handles for M-, P-, and R-Frame Circuit Breakers

Description	Frame	Field-Installed Cat. No.
Standard	R-Frame	S33997
Standard Short	M-, P-Frame	S46998
Long	M-, P-Frame	S46996

Door Escutcheons

Accessory cover door escutcheons are available for all M-frame, P-frame, R-frame and NS630b–NS3200 circuit breakers. Toggle door escutcheons are also available for fixed-mounted, P-frame, manually-operated circuit breakers.

Door Escutcheons for M-, P-, and R-Frame Circuit Breakers

PowerPacT M-, P-, and R Frame Locking Accessories

Field-installable handle padlock attachments are available for manually-operated circuit breakers. These attachments will accommodate three padlocks with a shackle diameter of 3/16–5/16 in. (5–8 mm) and will lock the circuit breaker in the O/OFF position only.

A handle padlock attachment is also available for locking manually-operated circuit breakers in either the I/ON or O/OFF position. This attachment will accommodate three padlocks with a shackle diameter of 3/16–5/16 in. (5–8 mm) and is available as factory or field installation.

Kirk key interlock brackets are also available for locking circuit breakers in the O/OFF position only. Not available for drawout P-frame or NS630b–NS1600.

Circuit breakers with rotary handles come standard with provision for padlocking the handle in the O/OFF position only. Key locks are also available for locking the circuit breaker in the I/ON or O/OFF positions.

A keylock or padlock provision for padlocking the circuit breaker in the O/OFF position is optional on electrically-operated P-frame and NS-630b–NS1600 circuit breakers.

Sub-Feed Lugs

Sub-feed lug kits are UL Listed for use on Listed equipment. They have plug-on jaw construction and plug on to the I-Line bus stack in the same manner as branch circuit breakers. Lugs on these devices accommodate the same wire sizes as the equivalent ampere rated circuit breakers.

I-Line Sub-Feed Lug Kit Terminations

Section 10—P-Frame Cradles and Cradle Accessories

P-Frame Circuit Breaker and Cradle Design

P-Frame Circuit Breaker and Cradle Design

Drawout Circuit Breaker

Cradle

- A—Terminal Cover
- B—Lifting Tabs
- C—Extension Rail Handle
- D—Padlock Provision
- E—Position Indicator
- F—Crank Insertion Opening
- G—Stop Release Button
- H—Crank Storage Space

NOTE: See Cradle Catalog Numbers, page 21 for cradle catalog numbers.

P-Frame Drawout Mechanism

The drawout assembly mechanism allows the circuit breaker to be racked in four positions (connected, test, disconnected, or withdrawn), as shown in the figure below.

NOTE: For UL/CSA Listed devices, the clusters are mounted on the circuit breaker and the stabs are on the cradle. For IEC devices, the clusters are mounted on the cradle and the stabs are mounted on the circuit breaker.

P-Frame Drawout Connectors

P-Frame Cradle Accessories

P-Frame Cradle Position Switches

Three optional cradle position switches are available for the cradle:

- Cradle position switches (CE) to indicate the connected position
- Cradle position switches (CD) to indicate the disconnected position. This position is indicated when the required clearance for isolation of the power and auxiliary circuits is reached.
- Cradle position switches (CT) to indicate the test position. In this position, the power circuits are disconnected and the auxiliary circuits are connected.

Cradle Position Switches

Switch Type	CE	CD	CT	Cat. No.	CE	CD	CT	Cat. No.
Maximum Push-In Switches	3	2	1		3	2	1	
Breaking Capacity at a Power Factor (pf) of 0.3	Standard: 10 mA / 24 V Min. Load			S33170	Low-Level: 1 mA / 4 V Min. Load ¹⁰⁹			S33171
	240 Vac	8 A			24-48 Vac	5 A		
	380 Vac	8 A			240 Vac	5 A		
	480 Vac	8 A			380 Vac	5 A		
	600-690 Vac	6 A			24-48 Vdc	2.5 A		
	24-48 Vdc	2.5 A			125 Vdc	0.8 A		
	125 Vdc	0.8 A			250 Vdc	0.3 A		
	250 Vdc	0.3 A						

109. If the maximum voltage and current is exceeded, the low-level function of the switch will be lost but the switch will continue to function as a standard switch with standard switch specifications.

P-Frame Cradle Locking and Interlocking

Disconnected Position Locking

The circuit breaker can be locked in the disconnected position by key interlock (optional, catalog number S33772) or padlock (standard). The key interlock is on the cradle and accessible with the door locked.

- Kirk key interlocks are available for UL/CSA circuit breakers. Key is captive when circuit breaker is closed.
- Locking in all positions (disconnected, test, and connected) is possible. Factory standard setting is locking in disconnected position.

Door Interlock

The door interlock (catalog number S33786) prevents the compartment door from being opened when the circuit breaker is in the connected or test position. If the circuit breaker is put into the connected position with the door open, the door can be closed without disconnecting the circuit breaker. For greater protection, this interlock can be used in conjunction with the open door racking interlock.

P-Frame Open Door Racking Interlock

The racking interlock (catalog number S33788) prevents racking in the circuit breaker when the door is open. (Insertion of the circuit breaker racking crank is not possible when the compartment door is open.)

Cradle Rejection Kits

The cradle rejection feature (optional, catalog number S33767) ensures that only the properly designated circuit breaker or switch is matched with the selected cradle assembly.

P-Frame Cradle Miscellaneous Accessories

Shutter and Shutter Lock

The shutters automatically block access to the main disconnects when the circuit breaker is in the disconnected, test, or fully withdrawn position. The shutter lock is used to prevent connection of the circuit breaker or to lock the shutters in the closed position.

The optional shutter assembly (catalog number S48933) consists of shutter and padlock provision.

Door Escutcheon (CDP)

The door escutcheon (catalog number S33857) provides a frame and seal for the circuit breaker.

Transparent Cover for Door Escutcheon (CCP) (P-Frame Only)

The door escutcheon cover (catalog number S33859) is hinge-mounted and is designed to be installed on the door escutcheon for the P-frame drawout circuit breaker.

Communication Components and FDM121 Connections

Connections

PowerPact and ComPact circuit breakers are connected to the ULP devices (FDM121 display, IFM, IFE or IO module) via the circuit breaker ULP cord.

- Cord is available in three lengths: 0.98 ft. (0.35 m), 4.3 ft. (1.3 m) and 9.8 ft. (3 m).
- Lengths up to 32.9 ft. (10 m) are possible using extensions.

Basic Electronic Trip Unit ET 1.0, M-Frame 800 A Characteristic Trip Curve

Electronic Trip 1.0

Characteristic Trip Curve No. 613-14

Long-Time Pickup and Delay
Instantaneous Pickup and Delay
2x – 10x

The time-current curve information is to be used for application and coordination purposes only.

Curves apply from -30°C to +60°C (-22°F to 140°F) ambient temperature.

Notes:

1. There is a memory effect that can act to shorten the long-time delay. The memory effect comes into play if a current above the long-time delay pickup value exists for a time and then is cleared by the tripping of a downstream device or the circuit breaker itself. A subsequent overload will cause the circuit breaker to trip in a shorter time than normal. The amount of time delay reduction is inverse to the amount of time that has elapsed since the previous overload. Approximately 20 minutes is required between overloads to completely reset memory.
2. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.

Basic Electronic Trip Unit 1.0I P- and R-Frame Characteristic Trip Curve

Electronic Trip 1.0I Characteristic Trip Curve No. 613-12

Long-time Pickup and Fixed Delay
Instantaneous Pickup
1.5x-12x

The time-current curve information is to be used for application and coordination purposes only.

Curves apply from -25°C to +70°C (-13°F to +158°F) ambient temperature.

Instantaneous override values are given on 613-10.

Notes:

1. There is a thermal-imaging effect that can act to shorten the long-time delay. The thermal-imaging effect comes into play if a current above the long-time delay pickup value exists for a time and then is cleared by the tripping of a downstream device or the circuit breaker itself. A subsequent overload will cause the circuit breaker to trip in a shorter time than normal. The amount of time delay reduction is inverse to the amount of time that has elapsed since the previous overload. Approximately 20 minutes is required between overloads to completely reset thermal-imaging.
2. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.

**MicroLogic 2.0 A Trip Unit
Characteristic Trip Curve No. 613-9**

Long-time Pickup and Delay
Short-time Pickup with No Delay

The time-current curve information is to be used for application and coordination purposes only.

Curves apply from -25°C to +70°C (-13°F to +158°F) ambient temperature.

Instantaneous override values are given on 613-10.

Notes:

1. There is a thermal-imaging effect that can act to shorten the long-time delay. The thermal-imaging effect comes into play if a current above the long-time delay pickup value exists for a time and then is cleared by the tripping of a downstream device or the circuit breaker itself. A subsequent overload will cause the circuit breaker to trip in a shorter time than normal. The amount of time delay reduction is inverse to the amount of time that has elapsed since the previous overload. Approximately 20 minutes is required between overloads to completely reset thermal-imaging.
2. The end of the curve is determined by the short-time setting.
3. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.
4. Overload indicator illuminates at 100%.

MicroLogic 3.0A P-Frame and R-Frame Trip Unit Characteristic Trip Curve

MicroLogic 3.0 A Trip Unit Characteristic Trip Curve No. 613-6

Long-time Pickup and Delay

The time-current curve information is to be used for application and coordination purposes only.

Curves apply from -25°C to +70°C (-13°F to +158°F) ambient temperature.

Notes:

1. There is a thermal-imaging effect that can act to shorten the long-time delay. The thermal-imaging effect comes into play if a current above the long-time delay pickup value exists for a time and then is cleared by the tripping of a downstream device or the circuit breaker itself. A subsequent overload will cause the circuit breaker to trip in a shorter time than normal. The amount of time delay reduction is inverse to the amount of time that has elapsed since the previous overload. Approximately 20 minutes is required between overloads to completely reset thermal-imaging.
2. The end of the curve is determined by the instantaneous setting of the circuit breaker.
3. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.
4. See 613-8 for instantaneous pickup trip curve.

MicroLogic 3.0A P-Frame and R-Frame Trip Unit Characteristic Trip Curve

**MicroLogic 3.0 A Trip Unit
Characteristic Trip Curve No. 613-8**

Instantaneous Pickup
1.5x-12x

The time-current curve information is to be used for application and coordination purposes only.

Curves apply from -25°C to +70°C (-13°F to +158°F) ambient temperature.

Instantaneous override values are given on 613-10.

Notes:

1. The end of the curve is determined by the interrupting rating of the circuit breaker.
2. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.
3. The instantaneous region of the trip curve shows maximum total clearing times. Actual clearing times in this region can vary depending on the circuit breaker mechanism design and other factors. The actual clearing time can be considerably faster than indicated. Contact your local Sales Office for additional information.
4. See 613-6 for long-time pickup and delay trip curves.

400 A < $I_n \leq 1200$ A

The time-current curve information is to be used for application and coordination purposes only.

Curves apply from -25°C to +70°C
(-13°F to +158°F) ambient temperature.

MicroLogic 6.0 P-Frame, R-Frame and NS630b–NS3200 A/P/H Trip Units with Adjustable Ground-fault Pickup and Delay Characteristic Trip Curve

**MicroLogic 6.0 A/P/H Trip Unit
With Adjustable Ground-Fault Pickup and Delay
Characteristic Trip Curve No. 613-3**

Ground-fault I^2t OFF and ON
 $I_n > 1200$ A

The time-current curve information is to be used
for application and coordination purposes only.

Curves apply from -25°C to $+70^\circ\text{C}$
(-13°F to $+158^\circ\text{F}$) ambient temperature.

Basic Electronic Trip Unit 1.0M, P-Frame 600 A MDP Characteristic Trip Curve

**Basic Electronic Trip Unit 1.0M, 600 A
Characteristic Trip Curve No. 613-13**
Instantaneous Pickup, 2X to 16X

The time-current curve information is to be used for application and coordination purposes only.

Curves apply from -25°C to +70°C (-13°F to +158°F) ambient temperature.

Instantaneous override values are given on page 214.

Notes:

1. The end of the curve is determined by the interrupting rating of the circuit breaker.
2. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.
3. The instantaneous region of the trip curve shows maximum total clearing times. Actual clearing times in this region can vary depending on the circuit breaker mechanism design and other factors. The actual clearing time can be considerably faster than indicated. Contact your local Sales Office for additional information.

Basic Electronic Trip Unit 1.0M P-Frame 800–1200 A MCP Characteristic Trip Curve

**Basic Electronic Trip 1.0M
800 A–1200 A
Characteristic Trip Curve No. 613-11**
Instantaneous Pickup, 1.5X to 12X

The time-current curve information is to be used for application and coordination purposes only.

Curves apply from -25°C to +70°C (-13°F to +158°F) ambient temperature.

Instantaneous override values are given on page 214.

Notes:

1. The end of the curve is determined by the interrupting rating of the circuit breaker.
2. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.
3. The instantaneous region of the trip curve shows maximum total clearing times. Actual clearing times in this region can vary depending on the circuit breaker mechanism design and other factors. The actual clearing time can be considerably faster than indicated. Contact your local Sales Office for additional information.
