Modicon® STB

distributed I/O solution

Open and modular system

Introduction

To meet the needs of machine manufacturers and users, automation architectures have been decentralized, while delivering performance comparable to that of centralized systems.

Architectures installed as close to the machine as possible reduce the time and cost of wiring for sensors and actuators, while increasing system availability.

The Modicon® STB distributed I/O solution is an open, modular input/output system and makes it possible to design automation stations managed by a master controller via a bus or communication network. These stations can be used to connect:

- Motor starters
- Variable speed drives
- Magelis® communication terminals HMI
- Approved third-party products via the CANopen bus: Festo®, Parker® valves, FTB IP 67 distributed I/O, ATV variable speed drives, encoders, etc.

Modicon software guides users through the design phase, startup, and maintenance of the system. This single software package covers the Modicon STB, OTB, FTB, and FTM ranges.

These station components are electronic modules mounted on one or more DIN rails. These clusters of modules, known as segments, carry a bus from end to end of each station. The station bus provides power distribution, signal sensing, and power management to compatible modules, in the form of a wiring management system.

Color code	Type of module
	NIM network interface EOS/BOS station extension CANopen extension
	24 V ... digital inputs
	24 V ... power distribution 24 V ... digital outputs
	115 V ~ or 230 V ~ digital inputs
	115/230 V ~ power distribution 115/230 V ~ digital outputs
	Digital relay outputs TeSys® U, TeSys® Quickfit and Tego™ Power interface, counter module
	Analog inputs
	Analog outputs

The Modicon STB I/O family is divided into 2 groups of modules:

- **Basic modules:** A complete set of low-cost modules and network interfaces, with simplified operating modes.
- **Standard modules:** An extended offer of I/O modules, with additional functions: configurable parameters, extended operating modes.

Both the basic and standard ranges comprise:

- NIM modules: network interfaces
- Power Distribution Modules (PDM) (24 V ... and 115/220 V ~)
- I/O modules:
 - Digital I/O (24 V ... and 115/220 V ~)
 - Analog I/O (10, 12 and 16-bit resolution)
 - Relay outputs (24 V ... coil and 24 V ... or 115/230 V ~ contact)
- Application-specific I/O module: Counter module
- Dedicated modules:
 - for TeSys® motor starters, model U and TeSys® Quickfit applications
 - for Tego™ power applications
- EOS (end of segment) and BOS (beginning of segment) modules.
- External equipment support module on CANopen extension

Standard and basic modules can be combined on the same station. This combination allows a wide range of functions. See the table on page 15.

The sensors and actuators are connected to the I/O modules via a removable screw or spring-type terminal.

Standard Modicon STB modules are hot-swappable, provided the network interface modules are also standard type.

Modicon STB distributed I/O have a protection rating of IP 20. For installations in production workshops, they must be installed in protective casings with at least an IP 54 rating (in compliance with IEC 60950 or NEMA 250). See page 122.

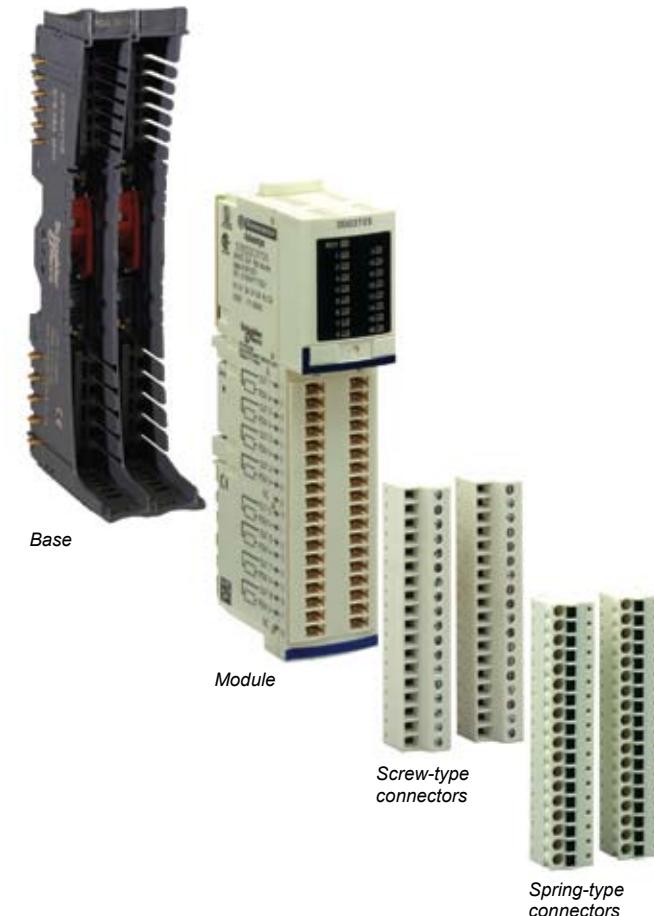

Modicon® STB distributed I/O solution

Open and modular system

Modicon® STB connection kit

The Modicon® STB kit references allow you to acquire the following items under a single reference (1) :

- A module
- Its base
- If necessary, a choice of the appropriate screw-type or spring-type connectors

The references are in the following format:

Content	Typical reference
Base, module, screw-type and spring-type connectors	STB ••• ••• K
Base, module, screw-type connectors for 16-channel modules STB DDI 3725 and STB DDO 3705	STB DD• 37•5 KS
Base, module, spring-type connectors for 16-channel modules STB DDI 3725, STB DDO 370 and STB EHC 3020 counter module	STB ••• ••• KC
NIM network module, base not required, supplied with one connector of each type: screw-type and spring-type	STB N•• •••

Modicon STB I/O modules without a base or connector are also available under the usual references.

These references are used in the descriptions contained in this catalog (functions, specifications, etc).

Details of the kits and their contents are given on the "References" pages.

(1) The STB EPI 1145 module is not available with a connector kit.

Composition of a Modicon® STB station

A Modicon® STB station is made up of one or more segments comprising Power Distribution Modules (PDM) and I/O modules.

A Modicon STB station starts with a network interface module and ends with a bus terminator supplied with this module. A station can be made up of a single segment or a primary segment and up to 6 extension segments, chained by End Of Segment (EOS) and Beginning Of Segment (BOS) extension modules.

On each segment:

- The PDMs must be placed immediately to the right of the network interface modules or extension modules.
- The I/O modules are placed to the right of the PDM module supplying them with power.
- Every module, PDM or I/O, is held in a base on the DIN rail (1). Three module and base widths are possible. The overall width needed for a segment on a DIV rail is the combined widths of the network interface module, the bases and any bus termination.

The bases help ensure the continuation of the internal bus, the auto-addressing of the modules, and the separated and isolated distribution of the internal power supplies, actuators and sensors.

The advantages of this arrangement are:

- Unplugging modules:
 - When switched off (*cold swap*), modules can be unplugged very quickly.
 - When switched on (*hot swap*), I/O modules can be unplugged provided the network interface module is the standard type.
- Output power supply independent of inputs: For example, if an output power supply is cut by a Preventa™ safety module, the inputs are still managed.
- Immunity of inputs: For example, the closing of power contactors (controlled by outputs) does not disturb analog input measurements.

The Network Interface Module (NIM)

This module manages communications on the station bus. It acts as a gateway for exchanges with the fieldbus or network master. Eleven NIM models are available for seven fieldbuses or networks: Ethernet TCP/IP (standard only), CANopen, Modbus Plus™ (standard only), Fipio® (standard only), INTERBUS®, Profibus DP™ and DeviceNet™ interface modules.

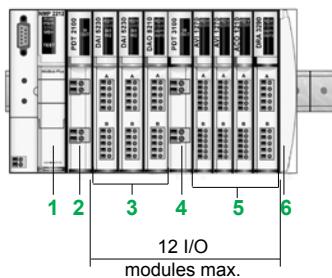

(1) Each module, with the exception of the NIM network interface module, requires a base and one or more specific connectors.

Description of basic Modicon® STB

Basic Modicon® STB: Single segment

With a basic network interface module it is possible to create a station with only one segment (single segment) with up to 12 I/O modules. This excludes segment power distribution modules, a network interface module and a bus termination.

Single segment basic Modicon STB

In the example above, the single segment contains:

- 1 STB N• 1010: A Network Interface Module (NIM). It is placed at the beginning of the primary segment. Each station must have only one NIM module.
- 2 STB PDT 2105: A Power Distribution Module (PDM). It is installed immediately to the right of the NIM and distributes the 115/230 V ~ to the AC powered I/O modules.
- 3 STB DA•: Digital I/O modules powered with AC.
- 4 STB PDT 3105: PDM power distribution module. It is installed after the 115/230 V ~ I/O modules. It distributes the 24 V --- to the DC powered I/O modules.
- 5 STB AV• and STB AC•: Analog I/O modules powered with DC are installed after the PDM module.
- 6 STB XMP 1100: Bus termination supplied with the NIM network interface module.

Internal power supply: The NIM network interface module STB N• provides a 5 V --- logic voltage (1.2 A) from an external 24 V --- power supply.

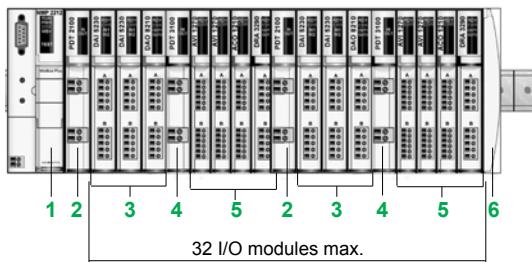

Modicon® STB distributed I/O solution

Open and modular system

Standard Modicon® STB configurations

Standard Modicon® STB: Single segment

With a NIM standard network interface module it is possible to create a station with only one segment (single segment) with up to 32 I/O modules. This excludes segment power distribution modules, a network interface module and a bus termination.

Single segment standard Modicon STB

In the example above, the primary segment contains:

- 1 STB N• 2212: A standard Network Interface Module (NIM). It is placed at the beginning of the primary segment. Each station must have only one NIM module.
- 2 STB PDT 210•: A Power Distribution Module (PDM). It is installed immediately to the right of the NIM and distributes the 115/230 V ~ to the AC powered I/O modules.
- 3 STB DA•: Digital I/O modules powered with AC.
- 4 STB PDT 310•: PDM power distribution module. It is installed after the 115/230 V ~ I/O modules and distributes the 24 V --- to the DC powered I/O modules.
- 5 STB AV•, STB AC•, STB DD•: Digital or analog I/O modules powered with DC. They are installed after the PDM STB PDT 310• module.
- 6 STB XMP 1100: Bus termination.

Internal power supply: The auxiliary power supply module STB CPS 2111 supplies a 5 V --- logic voltage (1.2 A) from an external 24 V --- power supply.

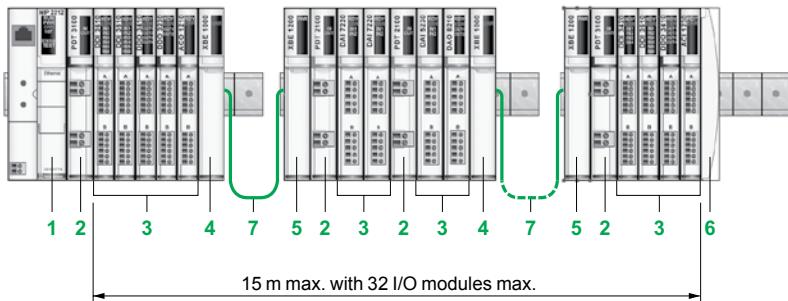

The STB CPS 2111 should be associated with an STB PDT •10• power supply module

Modicon® STB distributed I/O solution

Open and modular system

Standard Modicon® STB: Primary segment with extension segments

The station bus can support the primary segment with up to 7 extension segments. A standard NIM network interface module supports up to 32 I/O modules (excluding power distribution modules, network interface module, bus termination, auxiliary power supplies, and EOS/BOS bus extension modules).

Standard Modicon STB with 3 segments

The segments of the above Modicon STB configuration comprise:

- 1 STB NIM 2212: A NIM network interface module. It is placed at the beginning of the primary segment. Each station must have only one NIM module.
- 2 STB PDT 1100: A PDPM power distribution module (24 V $\perp\!\!\!\perp$ or 115/230 V \sim). It is installed immediately to the right of the NIM and distributes 24 V $\perp\!\!\!\perp$ or 115/230 V \sim depending on the type of I/O modules located on the right.
- 3 STB AV \bullet , STB AC \bullet , STB DD \bullet , STB DA \bullet and STB DR \bullet : I/O modules powered with DC or digital modules powered with AC are placed immediately to the right of the PDM.
- 4 STB XBE 1100: EOS bus extension module is always installed in the rightmost slot in the primary or extension segment and it extends the station bus to another segment.
- 5 STB XBE 1300: BOS bus extension module is installed at the beginning of each extension segment.
- 6 STB XMP 1100: Station bus termination (1).
- 7 STB XCA 100 \bullet : Station bus extension cables.

Internal power supply for secondary segments: The BOS bus extension module STB XBE 1300 provides a 5 V $\perp\!\!\!\perp$ logic voltage from an external 24 V $\perp\!\!\!\perp$ power supply.

(1) Supplied with the corresponding NIM network interface module.

Modicon® STB distributed I/O solution

Open and modular system

Standard Modicon® STB: CANopen extension module - device integration

The CANopen extension module STB XBE 2100 can be used to connect, at the end of the segment, external CANopen devices such as:

- Modicon® FTB IP67 I/O, in plastic or metal casing
- ATV31/61/71 variable speed drives
- Festo® CPV-CO2 electro-pneumatic valves
- Parker® P2M2HBVC11600 electro-pneumatic valves
- Balluff® Micropulse® BTL5 linear encoders
- Osicoder absolute rotary encoders (1)

The number of CANopen external devices depends on the station's standard network interface module:

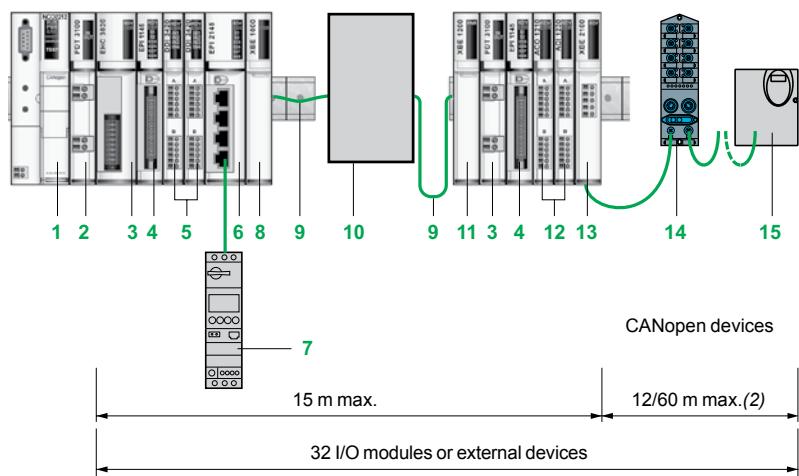

CANopen, DeviceNet™: Up to 7 external devices.

Ethernet TCP/IP Modbus®, Modbus Plus™, INTERBus®, Profibus DP™, Fipio® interface modules

Up to 12 external devices.

The data rate of the internal bus is set to 500 Kbps with the Advantys™ STB SPU 1●●● configuration software. This speed applies to Modicon STB modules and external devices.

Standard Modicon STB: Application-specific modules, preferred module and devices

Standard Modicon STB with CANopen devices

A standard network interface module supports up to 32 I/O modules and CANopen devices (excluding power distribution modules, network interface module, bus termination, auxiliary power supplies, EOS/BOS bus extension modules and CANopen STB XBE 2100 extension module).

The station bus can support:

- Preferred modules (available later). This type of preferred module is installed between two segments.
- Standard CANopen devices.

The station bus illustrated above contains:

- 1 STB N●● 2212: A Network Interface Module (NIM)
- 2 STB PDT 3100: A 24 V ... Power Distribution Module (PDM)
- 3 STB EHC 3020: 1-channel counter module
- 4 STB EPI 1145: Parallel interface module
- 5 STB DDI 3420: Digital input modules
- 6 STB EPI 2145: Module for TeSys® starter-controllers, model U (3)
- 7 TeSys U or TeSys Quickfit starter-controller
- 8 STB XBE 1110: EOS bus extension module
- This is always installed in the rightmost slot in the primary or extension segment, and is used to extend the station bus to another segment.
- 9 STB XCA 100●: Station bus extension cables
- 10 Preferred module
- 11 STB XBE 1300: BOS bus extension module placed at the beginning of the segment
- 12 STB AC●: Analog I/O modules
- 13 STB XBE 2100: CANopen extension module (up to 12 devices per station)
- 14 Modicon FTB IP67 I/O
- 15 ATV variable speed drive

(1) To obtain the latest list of approved equipment on the Modicon STB station extension, please consult your Regional Sales Office or visit www.schneider-electric.us.

To validate a new product, please consult your Regional Sales Office.

(2) Total length of extension CANopen segment: 12 m as standard, 60 m in accordance with the CAN wiring rules described in the CANopen setup document no. 31010857 (in English) available on www.schneider-electric.us.

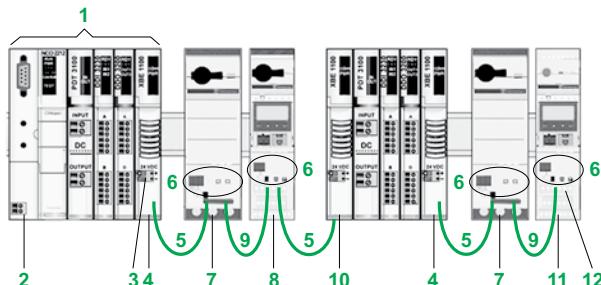

(3) Refer to the "Automation & Control - Motor starter solutions - Control and protection components" catalog.

Modicon® STB distributed I/O solution

Open and modular system

Standard Modicon® STB: TeSys® starter-controller model U, preferred

Modicon® STB provides TeSys® U with additional I/O and acts as a gateway to any upstream fieldbus or communication network connected by Modicon STB.

Modicon STB LULC15 communication modules

- 1 Modicon STB I/O.
- 2 Network interface module (NIM).
- 3 24 V DC power supply for LULC15.
- 4 End of segment (EOS) STB XBE 1100 used to mount the preferred TeSys U modules.
- 5 Angled cable with a station bus extension cable connector at each end, providing the bus signals and the internal power supply (LU9RCD••).
- 6 Modicon STB LULC15 communication modules.
- 7 TeSys U starter-controller (LUB••) with an advanced control unit (LUCB/C/D).
- 8 TeSys U starter-controller (LUB••) with a multifunction control unit (LUCM).
- 9 Angled cable with a station bus extension cable connector at each end, providing the bus signals and the internal power supply (LU9RDD••).
- 10 STB XBE 1300 beginning of segment.
- 11 TeSys U controller (LUTM) with a multifunction control unit (LUCMT).
- 12 TeSys U termination (LU9RFL15).

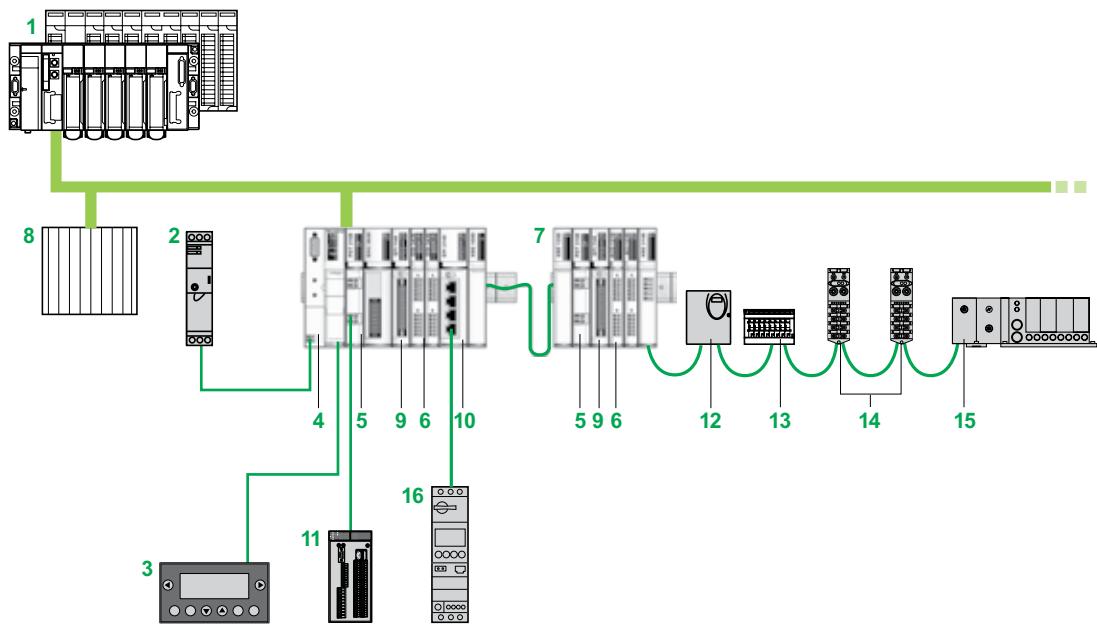

Modicon® STB distributed I/O solution

Open and modular system

Standard Modicon® STB configurations (continued)

NIM network interface modules STB N•• 2212 and STB N•• 1010, located at the beginning of each station, are gateways for exchanging data between the network or bus master PLC and the Modicon® STB automation station.

Standard STB N•• 2212 modules can also be used to configure and address the installation external devices. These settings are stored in the module's internal RAM or Flash memory. Optionally, they can be saved to the 32 Kb removable SIM card STB XMP 4440 – except for the address of the network connection point, to duplicate the configuration from one station to another.

- 1 Bus or network master.
- 2 24 V DC external power supply.
- 3 HMI with Magelis® display terminals XBT, XBT G, XBT GT type Modbus link (see link cables on page 109).
- 4 A Network Interface Module (NIM).
- 5 A Power Distribution Module (PDM).
- 6 I/O modules.
- 7 Second STB segment.
- 8 Another control system.
- 9 Parallel interface module for Tego™ Power application.
- 10 Parallel interface module for TeSys® U and TeSys Quickfit starter-controllers.
- 11 Configurable Preventa™ safety controller XPS MC connected on the power supply to the outputs of the power distribution module STB PDT •100.
- 12 ATV variable speed drive.
- 13 Festo® solenoid valves.
- 14 Modicon FTB IP67 I/O.
- 15 Parker® solenoid valves.
- 16 TeSys U starter-controller.

Basic/standard Modicon® STB functions

The table below describes the main functions of the basic and standard Modicon® STB ranges:

Modicon® STB	I/O modules		Network interface modules (NIM)		Power distribution modules (PDM)		See page
	Basic	Standard	Basic	Standard	Basic	Standard	
Max. number of I/O modules			12	32			8 to 11
Removable terminals							–
Mechanical keying pin							41
Cold swapping							12
Hot swapping (1) (3)							12
Separate power supply to sensors and actuators	(2)	(2)					28
Built-in electronic protection of outputs					(3)		–
Electronic protection of power supply provided by Modicon STB for the sensors							–
Protection of power supplies by built-in removable fuse							–
Status LEDs							–
Compatible with all types of network interface module							–
CANopen extension - device integration							12
Compatible with local HMI (Magelis® display terminals)							108
Default configuration							96
Assistance with design, startup, and maintenance using Modicon software (4)							96
Configurable I/O parameters (4)							97
Built-in reflex functions							100
Removable memory card (4) (5)							20
Advanced diagnostics (4)							98
Internal software (firmware) update							22

Function available

Function not available

Not applicable

(1) See page 16.

(2) Requires the use of standard power distribution modules.

(3) Fuse protection.

(4) Requires the use of a standard network interface module.

(5) For assistance with the station internal settings, simplifies inoperative device replacement (IDR) and copying of the station configuration.

Hot swapping

When a module on the Modicon® STB station is unplugged while the power is on, the behavior of the other modules depends on:

- the type of NIM network interface module (basic/standard)
- the parameter settings of standard type I/O modules:
 - mandatory/optional module
 - configured fallback type, per channel

Swapping a module	Type of network interface module	
	Basic NIM	Standard NIM (1)
Basic input	Outputs fall back to 0	The other outputs remain operational
Standard input optional	Outputs fall back to 0	The other outputs remain operational (1)
Standard input mandatory	Outputs fall back to 0	Fallback of other outputs according to configuration (1)(2)
Basic output	Outputs fall back to 0	The other outputs remain operational
Standard output optional	Outputs fall back to 0	The other outputs remain operational (1)
Standard output mandatory	Outputs fall back to 0	Fallback of other outputs according to configuration (1)(2)
Power distribution module (PDM)	Prohibited	Prohibited
Network interface module (NIM)	Prohibited	Prohibited

(1) Fallback level set by the Modicon STB SPU 1••• software on standard I/O modules with a standard NIM.

The STB SPU 1••• software cannot be connected on basic NIM modules.

(2) The fallback state is adjustable on standard output modules:

- Fallback to 0 for digital modules
- Fallback to 1 for digital modules
- Fallback to any value on analog outputs
- Hold last value on digital and analog outputs

Operating environment

Modicon® STB devices comply with the following certifications (1):

- UL
- CSA
- C-Tick
- GOST
- CE
- FM Class I, division 2, groups A, B, C and D T4A @ 70°C (158°F)
- ATEX is now available : ATEX 3G – II 3 G Ex nA IIC T4 Ta=0 to 60°C (32 to 140°F)

They benefit from merchant navy certifications issued by shipping classification societies:

- ABS (USA)
- BV (France)
- DNV (Norway)
- GL (Germany)
- LR (Great Britain)
- RINA (Italy)
- RMRS (IEC, pending)

They are designed for use in industrial environments of pollution class 2, in applications of over voltage category II (as defined in publication IEC 60664-1) and at altitudes of up to 2000 m, without reduction in load.

General environmental specifications

Parameter			Specifications
Protection			IP 20, Class 1. Ref. EN 61131-2
Operating temperature	Standard	°C (°F)	0 to 60 (32 to 140)
	Extended		-25 to 70 (-13 to 158) (2)
Storage temperature		°C (°F)	-40 to 85 (-40 to 185)
Maximum relative humidity			95% relative humidity at 60°C (140°C) (without condensation)
Sinusoidal vibration		Hz	10 to 58 at ± 0.35 mm 58 to 150 at 5 g on a 15 mm DIN rail 58 to 150 at 3 g on a 7.5 mm DIN rail
Shock		g	30 peak for 11 ms, semi-sinusoidal wave for 3 shocks per axis. Ref. IEC 88, reference 2-27

(1) Certifications for all automation products (see page 122).

(2) Temperature range available on certain Modicon STB modules. See the specifications pages.

Note: restrictions on power supply voltage. The power supply voltage of NIM's modules, STB XBE 1100/1300, STB CPS 2111, STB PDT 3100 modules, and any external power supply are limited as follow, depending on the operating temperature range:

- range -25 to 0°C (-13 to 32°F): the power supply voltage range is ... 20.4 to 30 V.
- range 0 to 60°C (32 to 140°F): the power supply voltage range is ... 19.2 to 30 V.
- range 60 to 70°C (140 to 158°F): the power supply voltage range is ... 19.2 to 26.5 V.

Modicon® STB distributed I/O solution

Network interface modules

Applications	Data exchange between master PLC and Modicon® STB I/O modules	
Bus or network type	Ethernet TCP/IP network	CANopen bus

Bus or network type	Industrial LAN	CAN fieldbus
Structure	Physical interface	
	10 BASE-T	ISO 1198
	Data rate	10 Mbps
		10 Kbps to 1 Mbps depending on bus length
Medium	Double shielded twisted pair via Ethernet ConneXium™ cabling system	Double shielded twisted pair
Configuration	Number of devices (1)	127 slaves
	Maximum length	100 m according to 802.3 standard 1000 m with ConneXium cabling system > 3000 m with fiber optic connection
		From 30 m (1 Mbps) to 5000 m (10 Kbps)
Features of NIM modules (Network Interface Modules)	Number of I/O modules per Modicon® STB station (1)	Standard NIM: 32 modules max. on 1 primary segment and 6 extension segments max. Basic NIM: 12 modules max. on 1 primary segment
	Supply voltage	24 V ... not isolated (19.2 to 30 V)
	Logic power supply	Provides 5 V ... logic power to the I/O modules of a station (1200 mA)
	CANopen devices supported	12 devices max. (2)
Services used	- Embedded Web (configuration, diagnostics and access to variables) - Modbus TCP/IP - SNMP agent - DHCP client service	- Process Data Object (PDO) - Service Data Object (SDO) - Network management (NMT)
Operating temperature (3)	0 to 60°C (32 to 140°F) (4)	
Type of NIM module	Standard	STB NIP 2212
	Basic (5)	STB NCO 2212
		STB NCO 1010

Modicon® STB

distributed I/O solution

Network interface modules

Introduction

The range of NIM network interface modules comprises 4 basic NIM modules and 7 standard NIM modules.

Each module is dedicated to a specific network or bus:

Network or bus	Basic network interface module	Standard network interface module
Ethernet network	—	STB NIP 2212
CANopen bus	STB NCO 1010	STB NCO 2212
Modbus Plus™ network	—	STB NMP 2212
Fipio® bus	—	STB NFP 2212
INTERBUS® bus	STB NIB 1010	STB NIB 2212
Profibus DP™ bus	STB NDP 1010	STB NDP 2212
DeviceNet™ network	STB NDN 1010	STB NDN 2212

STB N●● ●●● references include a power supply connector of each type: one screw-type connector and one spring-type connector.

Power supply for network interface modules

Network interface modules are powered by an external 24 V \equiv power supply.

This voltage is converted to 5 V \equiv to provide logic power to the I/O modules of the main Modicon® STB segment.

This built-in 5V logic power supply provides a maximum current of 1.2 A.

For operations in extended temperature ranges, see page 22.

This current can be increased in each segment of an STB CPS 2111 auxiliary power supply that also provides a maximum current of 1.2 A. For operations in extended temperature ranges, see page 26.

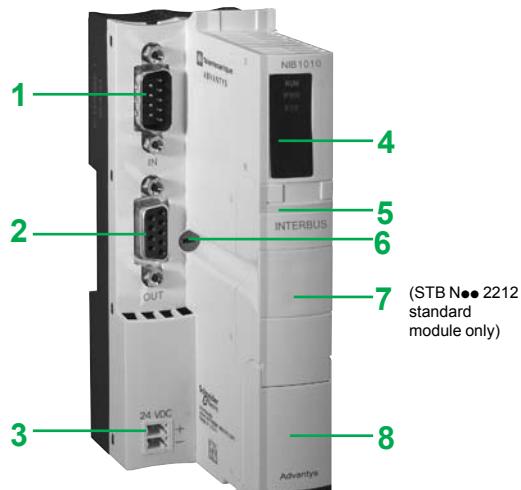

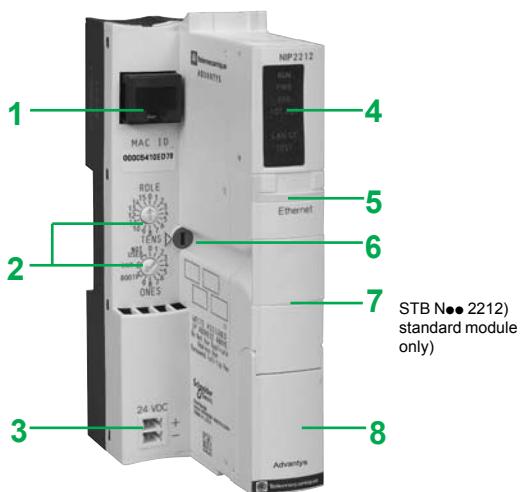

The STB CPS 2111 should be associated with an STB PDT ●10● power supply module.

Logic power for the I/O modules in each extension segment is provided by the BOS bus extension module STB XBE 1300 placed at the beginning of these segments. See page 26.

Description

Modicon® STB distributed I/O solution

Network interface modules

Description

Network interface modules STB N• 2212/1010

The front panel of the STB N• 2212/1010 network interface modules has the following features:

- 1 A connector to connect the station to the fieldbus. See photos of different connector types on pages 18 and 19 and specifications on page 23.
- 2 - All NIM modules except INTERBus® network interface modules: Two rotary node addressing selectors on the bus or the network
- INTERBus® STB NIB 2212/1010 network interface modules: One 9-way female SUB-D connector to connect the outgoing bus cable
- 3 An external 24 V --- power supply connector for the removable screw-type (STB XTS 1120) or spring-type (STB XTS 2120) terminals. External Phaseo® power supplies. See page 6.
- 4 An LED display block indicating the different states of the station on the bus: power, communication, send/receive data, detected errors, etc.

Indication	Basic NIM modules	Standard NIM modules
Station status: auto-configuration, operational, detected error, etc. (1)	Green RUN LED	Green RUN LED
Power supply: NIM powered up, internal 5 V operational	Green PWR LED	Green PWR LED
Module detected error (2)	Red ERR LED	Red ERR LED
1 to 3 LED status indicators	Depending on bus/network	Depending on bus/network
Test mode (3)	-	Yellow Test LED

- 5 A color-coded identification stripe: yellow
- 6 A screw for releasing the STB N• 2212/1010 module from the DIN rail. The NIM module can be removed from the station even if the product is assembled. Simply remove the PDM and then turn this screw a quarter turn.
- 7 A slot for a removable SIM card STB XMP 4440 (only on STB N• 2212 standard NIM modules)
- 8 **Standard NIM module:** Access flap for the Reset button (4) and the port used to connect a station setup and configuration PC or HMI terminal (read/write data). Can also be used to update the firmware for the network interface module (5).
Basic NIM module: Access flap for the Reset button (4) and the port used to connect a PC used only for updating the firmware of the network interface module.

The network interface modules are supplied with:

- An English language mini CD-ROM that contains supporting documentation, a label template and one exchange file per network type
- An STB XMP 1100 bus terminator that is mounted directly on the DIN rail.

The STB SUS 8800 CD-ROM contains specific documentation for each of the 11 network interface modules in 5 languages. These documents can also be downloaded from www.schneider-electric.us.

- (1) RUN is on permanently if the module is operational and flashes in various ways in the other states.
If RUN flashes on startup, the NIM module is in the auto-configuration phase.
If RUN flashes for a long time, there is a detected fault on the station. For information about status indications for the NIM module and the station, refer to the "Network interface module applications guide" for the specific network, included on the STB SUS 8800 CD-ROM or available on our web site: www.schneider-electric.us.
- (2) ERR is off when the station is OK. Otherwise, ERR flashes or is lit.
- (3) Test LED off: station OK. Test LED on: backup of parameters to internal memory or SIM card in progress. Test LED flashing: station in Test mode.
- (4) Pressing the Reset button for 4 seconds restores the station to the factory configuration or the configuration contained on the SIM card.
- (5) Firmware update of NIM modules available at www.schneider-electric.us.

The CANopen interface fieldbus is located on the front of the STB XBE 2100 extension module.

The pinout should be as indicated in the table below:

Pin	Signal
1	CAN earth ground (0 V)
2	CAN low bus signal
3	Optional CAN shielding
4	CAN high bus signal
5	No connection (4)

(1) The STB XTS ... connectors can accommodate a flexible wire with a maximum cross-section of 1.5 mm², including the cable end. Max. tightening torque = 0.25 Nm for screw-type connectors.

(2) Template for user-customizable labels:

- Supplied with the documentation mini-CD-ROM provided with the NIM network interface modules
- Available on www.schneider-electric.us.

(3) Observe the recommendations in the "Modicon STB System Hardware Components Reference Guide", included on the STB SUS 8800 CD-ROM and available on www.schneider-electric.us.

(4) This spare pin can be used to distribute the 24 V of external devices.

Introduction

Basic power distribution modules (PDM) (STB PDT •105) provide power for the I/O module sensors and actuators (1) via the same bus 3. See page 29.

Two basic PDMs are available:

- The STB PDT 3105 module is dedicated to providing power to the I/O module sensors and actuators requiring a 24 V --- power supply.
- The STB PDT 2105 module is dedicated to providing power to the I/O module sensors and actuators requiring a 115/230 V \sim power supply.

Each module has 1 removable fuse.

Standard power distribution modules (STB PDT •100) provide power separately for the I/O module sensors and actuators (1) via the sensor bus 1 and the actuator bus 2. See page 29.

Two standard PDMs are available:

- The STB PDT 3100 module is dedicated to providing power separately to the I/O module sensors and actuators requiring a 24 V --- power supply.
- The STB PDT 2100 module is dedicated to providing power separately to the I/O module sensors and actuators requiring a 115/230 V \sim power supply.

Each module has 2 removable fuses.

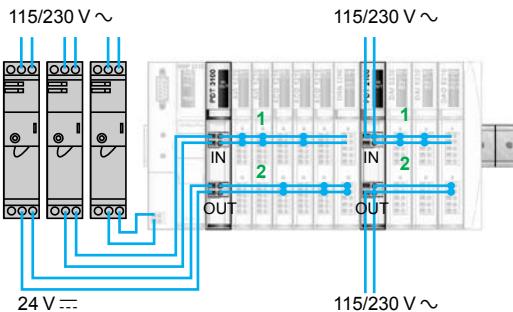

(1) One power distribution module can supply power to both digital and analog I/O modules simultaneously.

Modicon® STB distributed I/O solution

Power distribution modules

Connecting the power supplies

Three separate power supplies

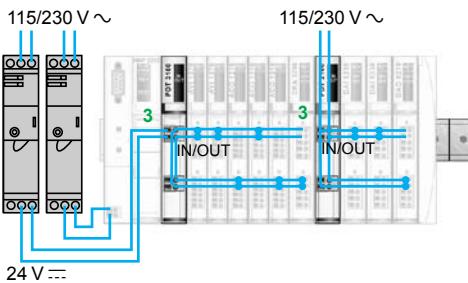

Configuration with standard PDM

This configuration allows:

- Disconnection of the I/O power supply while maintaining the power supply to the network interface module (NIM) and thus to the machine bus (for example, in a NIM INTERBus® configuration).
- Isolation of the output power from the inputs to increase immunity to electromagnetic interference.
- Power supply independent of the outputs, enabling connection of a Preventa™ safety module. If these outputs are disconnected, the inputs continue to be managed.

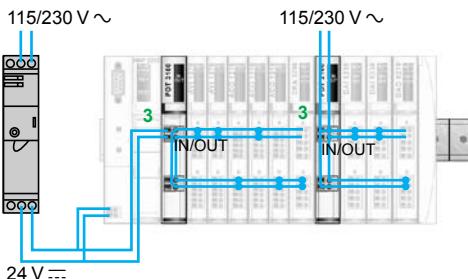

Separate NIM module and I/O power supplies

Configuration with basic PDM

This configuration allows disconnection of the I/O power supply while maintaining the power supply to the NIM module and thus to the machine bus (for example, in a NIM INTERBus configuration).

One single power supply

Configuration with basic PDM

Low-cost configuration with a single power supply for the NIM module, sensor bus, and actuator bus.

Modicon® STB

(1) STB bus extension modules can be connected to any PDM.

Modicon® STB distributed I/O solution

Power distribution modules

Description

The front panel of the STB PDT 2100 power distribution modules features:

- 1** A slot for a user-customizable label
- 2** A status block with 2 display LEDs (STB PDT 2100/3100 standard modules only)

Indication	Basic PDM modules	Standard PDM modules
Sensor bus power supply (1)	-	Green IN LED
Actuator bus power supply (1)	-	Green OUT LED

- 3** A color-coded module identification stripe (red for 115/230 V~, blue for 24 V---)
- 4** A connector for removable screw-type terminals (STB XTS 1130) or spring-type terminals (STB XTS 2130) used to connect:
 - The sensor power supply for STB PDT 2100/3100 standard modules
 - The sensor/actuator power supply for STB PDT 2105/3105 basic modules
- 5** A connector for removable screw-type terminals (STB XTS 1130) or spring-type terminals (STB XTS 2130) used to connect the actuator power supply (STB PDT 2100/3100 standard module only)
- 6** An STB XBA 2200 mounting base, width 18.4 mm, featuring:
 - A slot for a user-customizable label **7**
 - A captive grounding screw **8**

The STB SUS 8800 CD-ROM contains two documentation sets for the power distribution modules in 5 languages:

- *System Hardware Components Reference Guide*
- *System Planning and Installation Guide*

These documents can also be downloaded from www.schneider-electric.us.

(1) IN/OUT LED on: Power supply present on digital I/O modules.

IN/OUT LED off: No external power supply or removable fuse inside the PDM has blown.
Refer to the "System Hardware Components Reference Guide" included on the STB SUS 8800 CD-ROM or available from our web site: www.schneider-electric.us.

Mounting base (included in kits)		STB XBA 2200 width 18.4 mm				

(1) Use 24 V ... safety extra low voltage (SELV) external power supplies.

(2) STB PDT 3100 module only:

- range -25 to 0°C (-13 to 32°F): the power supply voltage range is ... 20.4 to 30 V.
- range 0 to 60°C (32 to 148°F): the power supply voltage range is ... 19.2 to 30 V.
- range 60 to 70°C (148 to 158°F): the power supply voltage range is ... 19.2 to 26.5 V.

(3) Take into account the total input and output currents: combined current.

(4) DC power supplies can be shared or separate, or shared with the 24 V ... power supply of the network interface module.

(5) AC power supplies for a given distribution module from a 3-phase transformer must be connected at the same phase.

(6) Built-in fuse on the power distribution module. Can be replaced with the STB XMP 5600 fuse kit.

Introduction

Modicon® STB digital input/output modules include:

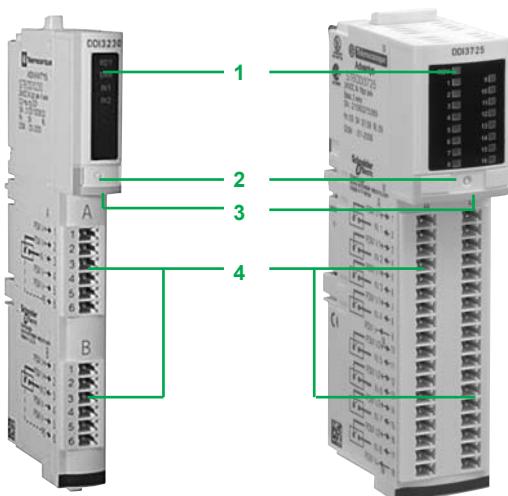

- Input modules
- Solid state output modules
- Relay output modules

The basic digital I/O module offer includes:

- 3 digital input modules:
 - 4, 6, and 16 x 24 V ... input channels
- 3 digital output modules:
 - 4, 6, and 16 x 24 V ... output channels

The standard digital I/O module offer includes:

- 6 digital input modules:
 - 2, 4, and 6 x 24 V ... input channels
 - 2 x 115 V ~ input channels (2 modules)
 - 2 x 230 V ~ input channels
- 6 solid state digital output modules:
 - 2 x 24 V ... output channels (2 modules)
 - 4 and 6 x 24 V ... output channels
 - 2 x 115 V ~ output channels
 - 2 x 115/230 V ~ output channels
- 2 relay output modules:
 - 2 relays with 1 N/C contact and 1 N/O contact
 - 2 relays with 1 C/O contact

Description

The front panel of digital I/O modules include:

- 1 A display block providing the following indication:

Indication	Basic I/O modules	Standard I/O modules
Module status: ready, pre-operational, operational	Green RDY LED	Green RDY LED
Module detected error (1)	– (2)	Red ERR LED
Status of each channel	Green LEDs IN1 to IN16 or OUT1 to OUT16 depending on module	Green LEDs IN1 to IN16 or OUT1 to OUT16 depending on module

- 2 A slot for a user-customizable label STB XMP 6700

- 3 A color-coded module identification stripe (See color codes on page 6.)

- 4 Two connectors for screw- or spring-type terminals

(1) RDY is on permanently if the module is operational and flashes differently in the other states.
If ERR is on or flashing, the module is inoperative.

For information about module and channel status indication, refer to the "System Hardware Components Reference Guide" included on the STB SUS 8800 CD-ROM or available on our web site: www.schneider-electric.us.

(2) Basic I/O modules: A module detected error is indicated by the ERR LED on the station's Network Interface Module (NIM).

distributed I/O solution

Digital I/O modules

Description (continued)

Mandatory parts to be ordered separately or included in kits

I/O module bases in 3 widths depending on the module:

Module size	Width	Base reference
1	13.9 mm	STB XBA 1000
2	18.4 mm	STB XBA 2000
3	28.1 mm	STB XBA 3000

These bases have:

- A slot for a user-customizable label STB XMP 6700 (1)
- 4 locations for placing the module/base keying pins (1).

Removable terminals

Connector type (2 connectors per module)	5-way	6-way	18-way
Screw terminals	STB XTS 1110 (pack of 20)	STB XTS 1100 (pack of 20)	STB XTS 1180 (pack of 2)
Spring terminals	STB XTS 2110 (pack of 20)	STB XTS 2100 (pack of 20)	STB XTS 2180 (pack of 2)

These removable terminals have between 5 and 18 different ways of coding the module/connector keying pins (1).

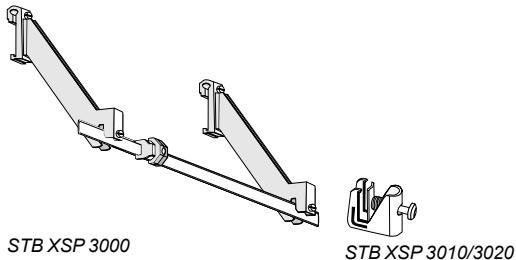

Optional parts to be ordered separately

Mechanical keying pins and identifiers

These devices help ensure that each I/O module, base and wiring connectors are properly matched after dismantling or replacement.

Keying of module and base (1)	Keying of module and connectors (1)	Module identification (2)	Base identification (2)
STB XMP 7700	STB XMP 7800	STB XMP 6700	STB XMP 6700

The user-customizable labels STB XMP 6700 make it much easier to recognize I/O modules and their bases.

External cable shielding connector

This optional device allows quick and easy connection of the external cable shielding (1).

Connection and shielding kit Lateral supports and metal bar, length 1 m	STB XSP 3000
Cable clamp size 1 (pack of 10) for shielded cable with external diameter 1.5 to 6 mm ²	STB XSP 3010
Cable clamp size 2 (pack of 10) for shielded cable with external diameter 5 to 11 mm ²	STB XSP 3020

Digital input modules and digital output modules (24 V \square , 115/220 V \sim and 2 A relay) include an optional ground connecting accessory.

For analog modules, it is advisable to use this device as it allows quick and easy connection of the external cable shielding (1).

(1) To find out how to code the keying pins and how to use the EMC kit, refer to the System Planning and Installation Guide included on the STB SUS 8800 CD-ROM or available on our web site: www.schneider-electric.us.

(2) Template file for printing labels on a laser printer (color or black and white) or manual marking with indelible felt pen: included on the mini CD-ROM supplied with each NIM network interface module or available on our web site: www.schneider-electric.us.

Modicon® STB

distributed I/O solution

Digital I/O modules

Digital output module operating modes

Output protection and reset following overload or short-circuit

Modicon® STB digital output module	Short-circuit and thermal overload protection	Actuator power supply protection	Reset	Diagnostics
Basic modules STB DDO 3415, 3605, 3705	Internal electronic	Via PDM fuse	On elimination of the detected fault	Per group of 2 channels

Standard modules STB DDO 3200, 3230 Actuator powered externally	Internal electronic	Via external fuse	User-configurable (1)	Per channel
Standard modules STB DDO 3410, 3600	Internal electronic	—	—	Per group of 2 channels
Standard modules STB DRC 3210, STB DRA 3290	External fuse	—	User-configurable (1)	—
Standard modules STB DAO 8210	External fuse	Via external fuse	User-configurable (1)	—
Standard modules STB DAO 5260	External fuse	—	User-configurable (1)	—

Behavior of digital output modules upon detected internal communication fault on the station or between PLC and NIM

Digital output STB module	Output fallback
Basic modules STB DDO 3415, 3605, 3705	0 (open output)
Standard modules STB DDO 3200, 3230, 3410, 3600 STB DRC 3210, STB DRA 3290 STB DAO 8210, STB DAO 5260	User-configurable (2)

(1) Reset is user-configurable: automatic on elimination of the detected fault (default factory configuration) or intentional by the PLC.

Each model is independently configurable. This operation requires the Advantys™ STB SPU 1••• configuration software.

The tripping data is transmitted to the PLC via the NIM network interface module.

(2) Fallback is user-configurable: to 0 (default factory configuration), to 1, or to "hold last value" for warm standby and hot standby applications.

Each output channel of each module is independently configurable.

This operation requires the Advantys STB SPU 1••• configuration software.

Modicon® STB distributed I/O solution

Digital I/O modules

Hot swapping and cold swapping of output modules			
Swapping a module	Hot swap		Cold swap
	Basic NIM	Standard NIM (3)	Any type of NIM
Basic digital output module	The other I/O modules fall back to level 0 (1)	The other I/O modules remain operational (2)	I/O modules and Power Distribution Modules (PDM) can be removed from the station.
Standard digital output module not configured "mandatory"	Not applicable (1)	The other I/O modules remain operational (1) (2)	The removable connectors make it easier to do this.
Standard digital output module configured "mandatory"	Not applicable (1)	Output fallback according to configuration (2) (3) Station in pre-operational mode. The inputs are no longer updated on the network/fieldbus.	
Power Distribution Module (PDM)	Illegal	Illegal	

(1) The STB SPU 1••• configuration software cannot be connected to a basic NIM. Any basic or standard I/O module is reconfigured according to the default factory configuration.

(2) The STB SPU 1••• configuration software can be connected via a standard NIM. Standard I/O modules can be configured.

Basic modules are not configurable (default factory configuration only).

(3) For standard digital output modules, the fallback state is configurable:

- Fallback to level 0
- Fallback to level 1
- Fallback to predefined level of the output range for analog modules
- Hold last value

Introduction

The STB analog inputs allow the acquisition of various analog values encountered in industrial applications.

The STB analog outputs are used to control analog-controlled actuators such as variable speed drives, proportional control valves, etc.

The basic analog I/O module offer includes:

- 3 analog input modules:
 - 2 analog voltage input channels 0 to 10 V
 - 2 analog current input channels \pm 10 V
 - 2 analog current input channels 4...20 mA

- 3 analog output modules:
 - 2 analog channels, current output 0...10 V
 - 2 analog channels, current output \pm 10 V
 - 2 analog channels, voltage output 4...20 mA

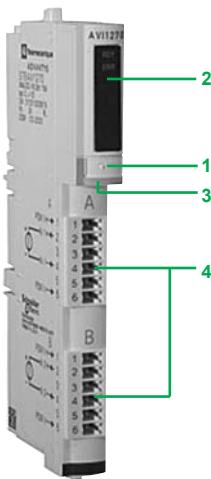

The standard analog I/O module offer includes:

- 8 analog input modules:
 - 2 analog voltage input channels \pm 10 V
 - 2 analog current input channels 0...20 mA
 - 2 channels for thermocouple, temperature probe or voltage (mV)
 - 4 analog input channels 15 bits + sign, current 4...20 mA and 0...20 mA
 - 4 analog input channels 15 bits + sign, current 4...20 mA and 0...20 mA, HART protocol tolerant
 - 4 analog input channels 15 bits + sign, voltage 1..5 V, 0...5 V, 0 to 10 V, -5 V to +5 V, -10 V to +10 V
 - 8 analog input channels 15 bits + sign, voltage 1..5 V, 0...5 V, 0 to 10 V, -5 V to +5 V, -10 V to +10 V
 - 8 analog input channels 15 bits + sign, current 4 to 20 mA and 0 to 20 mA

- 5 analog output modules:
 - 1 analog channel, current output 4 to 20 mA, 15 bits + sign
 - 2 analog channels, current output 0...10 V or \pm 10 V
 - 2 analog channels, current output 0...20 mA
 - 2 analog channels, current output 4...20 mA and 0...20 mA, 15 bits + sign
 - 2 analog channels, voltage output 1..5 V, 0...5 V, 0 to 10 V, -5 V to +5 V, -10 V to +10 V, 15 bits + sign

Modicon® STB distributed I/O solution

Analog input/output modules

Description

Analog I/O modules have the following on the front panel:

- 1 A slot for a user-customizable label
- 2 A display block showing the state of the module (RDY, ERR)

Indication	Basic analog I/O modules	Standard analog I/O modules
Module status (1)	Green RDY LED	Green RDY LED
Module detected error (2)	–	Red ERR LED

- 3 A color-coded module identification stripe (See color codes on page 6.)
- 4 Two connectors for screw- or spring-type terminals

The module kits comprise:

- An STB XBA 1000 mounting base, width 13.9 mm or STB XBA 2000, width 18.4 mm.

Removable terminals (6-way), screw-type STB XTS 1100 or spring-type STB XTS 2100.

To be ordered separately:

- Grounding of the cable shielding is mandatory. The optional grounding kit STB XSP 3000 can also be used to secure cables in installations subject to severe vibration.

- 5 Optional grounding kit STB XSP 3000

- 6 Terminals STB XSP 3010 for cables with cross-section 1.5 to 6 mm² or STB XSP 3020 for cables with cross-section 5 to 11 mm².

Optional mechanical keying pins:

- Between I/O module and I/O base: STB XMP 7700

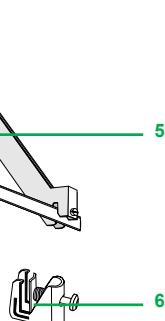

- Between wiring connectors and I/O module: STB XMP 7800

These devices help ensure that the I/O modules, bases and wiring connectors are properly matched after dismantling or replacement.

- User-customizable label sheets: STB XMP 7600

(1) RDY LED on: Module OK. RDY LED off: No power from PDM. RDY LED flashing: Detected fault present.

(2) ERR LED on: Internal detected error. ERR LED off: Module OK. ERR LED flashing: Module detected error. Refer to the "System Hardware Components Reference Guide" included on the STB SUS 8800 CD-ROM or available on our web site: www.schneider-electric.us.

(1) If the STB ACO 1230 module is configured with the STB SPU 1000 software, a zero offset can be set; for example, 4 to 20 mA.

(2) Actuator bus power supply separate from actuator power supply.

(3) Requires Advantys™ configuration software.

Modicon® STB distributed I/O solution

Parallel interface module STB EPI 2145
TeSys® U controller and TeSys® Quickfit applications

Description

The STB EPI 2145 application-specific parallel interface module is a component of the Modicon® STB station designed for the remote connection of TeSys® U starter-controllers and TeSys® Quickfit prewired motor starters.

The STB EPI 2145 application-specific parallel interface module includes:

- 1 An LED display block indicating the various states of the starter-controllers or TeSys Quickfit prewired motor starters

Indication	Standard STB EPI 2145 module
Module status (1)	Green RDY LED
Module detected error (2)	Red ERR LED
Selector switch position 4 (3)	Green LEDs S1 and S2
State of outputs	Green LEDs O1/5, O2/6, O3/7, O4/8

2 Slot for a user-customizable label

3 A color-coded identification stripe (black)

4 A selector switch used to view each motor starter state

5 4 RJ45 connectors for connection of:

- 4 TeSys model U starter-controllers
- 4 direct motor starters with TeSys Quickfit components
- 2 reversing motor starters with TeSys Quickfit components; for example, 12 inputs and 8 outputs in each of these configurations

The STB EPI 2145 K module kit comprises:

- STB XBA 3000 base, width 28.1 mm. This base includes a slot for a user-customizable label.

To be ordered separately:

- Optional mechanical keying pins between the module and the I/O base: STB XMP 7700. This device helps to ensure that the module and its base are properly matched if disassembled or replaced.
- Sheets of user-customizable labels: STB XMP 7600
- RJ45 cables between the STB EPI 2145 module and each TeSys U

(1) RDY is permanently on if the module is operational. If RDY is off, the PDM is not supplying power. If RDY is flashing, the module is not functional.

(2) If ERR is on or flashing, the module has an internal detected error.

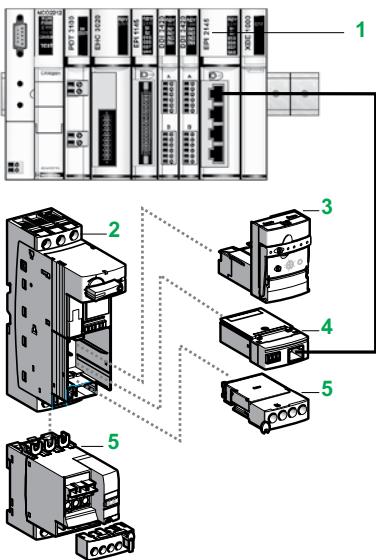

For information about module and channel status indication, refer to the "System Hardware Components Reference Guide" included on the STB SUS 8800 CD-ROM or available on our web site: www.schneider-electric.us.

(3) S1: Output bank 1 (outputs 1 to 4)

S2: Output bank 2 (outputs 5 to 8)

Modicon® STB distributed I/O solution

Parallel interface module STB EPI 2145
TeSys® U controller and TeSys® Quickfit applications

TeSys® U starter control application

Introduction of the TeSys® U starter-controller

The TeSys® U starter-controller is a direct motor starter that performs the following functions:

- Protection and control of single-phase or three-phase motors:
- Disconnects power
- Protects against overcurrent and short circuits
- Protects against thermal overload
- Performs power switching
- Application control:
- Provides protection alarms and application monitoring: duration of use, number of detected faults, motor current values, etc.
- Provides a logging function

Structure of a TeSys U starter with an STB EPI 2145 module (1)

The starter-controller functions are implemented with a click-lock adjustment, thus eliminating wiring of:

- A power base **2** (LU2B + LU9 BN11)
- A 24 V ... **3** control unit (LUC B/D/C/M ●●BL) for 0.09 to 15 kW motors
- A parallel communication module (LUF C00) **4**
- Options (additional contacts, reverser blocks) **5**, including LU9 M1●

Combined with a TeSys U starter, each of the 4 channels of the STB EPI 2145 application-specific module features:

- 2 outputs:
 - Starter control
 - Reversal control
- 3 inputs:
 - State of circuit breaker (position of lever)
 - Presence of detected faults (short circuit, thermal)
 - State of main contactor (closed/open)

(1) TeSys® U components: refer to the Starters and Basic TeSys U Equipment catalog

Modicon® STB distributed I/O solution

Parallel interface module STB EPI 2145
TeSys® Quickfit components for motor starters

TeSys® Quickfit components for motor starters

TeSys® Quickfit is a modular system that standardizes and simplifies the installation of motor starters.

Combined with GV2 ME circuit breakers and model d (LC1) contactors from 9 to 25 A, TeSys Quickfit facilitates the installation of motor starters with spring-type terminals up to 11 kW/400V.

TeSys Quickfit offers elements for prewiring of:

- Power circuits
- Control circuits

TeSys Quickfit makes the installation of motor starters a fast, easy, reliable, and open-ended process. It also:

- Allows for later customization of the motor starter
- Reduces maintenance time
- Saves space inside the equipment by reducing the number of terminals, cable ducts, and intermediary interfaces

Elements for prewiring the power section

The TeSys Quickfit system provides the following components for prewiring the power section:

- A power kit comprising, for each output, a mounting plate **1** for the contactor **2** and circuit breaker **3**, as well as two power connection modules, **4a** and **4b**
- A power splitter box **5** for 2 or 4 outputs
- An upstream terminal block **6** for connecting a power supply up to 60 A (16 mm²)
- A downstream terminal block **7** for connecting motor power supply cables and earth ground cables (6 mm²)

Elements for prewiring the control section

For prewiring the control section, the TeSys Quickfit system provides the **LAD 9 AP3●●** control connection module **8** that allows you to connect the motor starters to the processing unit (PLC) via the Modicon **STB EPI 2145** parallel interface module **9** quickly and without the use of tools.

The **LAD 9 AP3●●** control connection module is mounted directly on the contactor and the circuit breaker of each motor starter. It integrates the status and control information of this motor starter.

A mechanical locking device 2 for the system on the head of the contactor helps to ensure a correct connection regardless of the conditions of use (vibrations, shock, etc.). Four versions are available: direct or reversing start, and with or without contactor coil interface relay.

The lower part of the **LAD9 AP3 ●●** module features several external connectors, including an RJ45 socket, for connection to the Modicon **STB EPI 2145** parallel interface module via **LU9R●●** RJ45 cables **10** available in different lengths.

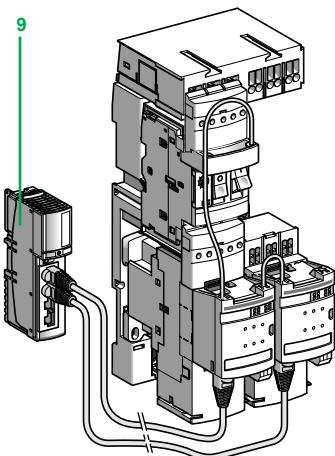

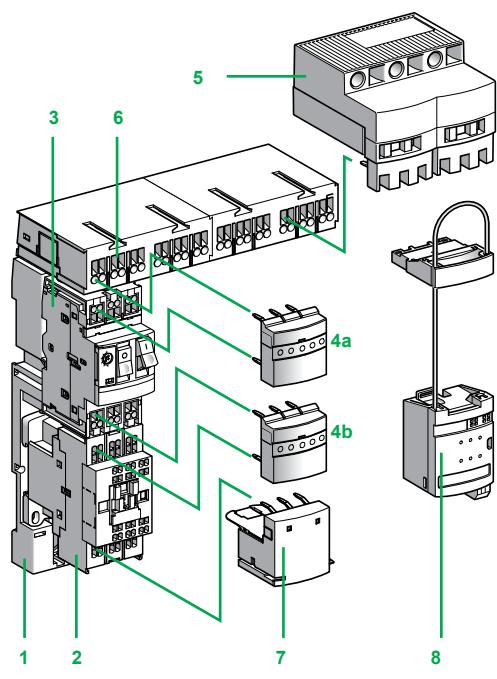

The following information is available for each motor starter:

- 2 inputs: status of circuit breaker and status of contactor
- 1 output: contactor coil control

A direct motor starter uses 1 RJ45 channel.

A reversing motor starter uses 2 RJ45 channels.

(1) Refer to the Motor Starter Solutions - Control and Protection Components catalog.

Specifications			
Module type		STB EPI 2145	
Cold swapping		Yes	
Hot swapping		Yes, depending on NIM and mandatory specification of module. See table on page 43.	
Connection		Via 4 RJ45 connectors	
Power supply		Via STB PDT 3100/3105 24 V ... power distribution module	
Protection		Via fuse of STB PDT 3100/3105 power distribution module	
Operating temperature, horizontal mounting		°C (°F)	-25 to 70 (-13 to 158)
Consumption	On 5 V ... logic bus	mA	110
	On 24 V ... sensor bus	mA	100 max.
	On 24 V ... actuator bus	mA	50 min. (with 8 outputs at state 0); 80 mA per output at state 1 (220 mA max., for 150 ms)

Introduction

The STB EPI 1145 parallel interface module is a component of the Modicon® STB station designed for the remote connection of 8 motor starters (or 4 motor starters in each direction). TeSys® motor starters, model D use the Tego™ Power installation assistance system.

The Tego™ Power System

Tego Power is a modular system to help install TeSys model d motor starters by providing prewired control and power circuits. This Quickfit technology enables cable-free connections to spring terminals for model d contactors (9 to 32 A) and GV2 M2 motor circuit breakers.

Tego Power with Quickfit technology enables you to create motor starter assemblies up to 15 kW/400 V.

Structure of the Tego Power system

The Tego Power system differentiates the power section from the control section.

- The power kit comprises:
 - One specific mounting plate for 2 to 8 motor starters
 - Two connection modules
 - One power splitter box with a power supply terminal
- The contactor for each motor starter is activated by one of the 8 outputs of the STB EPI 1145 parallel interface.
- The control kit comprises:
 - One control splitter box for the 2 to 8 motor starters
 - One connection module

The 2 return outputs of each motor starter (contactor status, circuit breaker status) are connected to 2 of the 16 inputs to the STB EPI 1145 parallel interface.

Description

The STB EPI 1145 parallel interface comprises:

- 1 An LED display block indicating the various states of the motor starters.

Indication	Standard STB EPI 1145 module
Module status (1)	Green RDY LED
Module detected error (2)	Red ERR LED
Selector switch position 4 (3)	Green LEDs S1 and S2
State of outputs	Green LEDs O1/5, O2/6, O3/7, O4/8

- 2 Slot for user-customizable label
- 3 A color-coded identification stripe (black)
- 4 A selector switch used to view each motor starter state
- 5 An HE 10 connector (30-way) to connect to a Tego Power system via STB XCA 3002/3003 cables (1 m/2 m)

To be ordered separately:

- STB XBA 2000 base, width 18.4 mm. Includes a slot for a user-customizable label.
- Optional mechanical keying pin between the module and the STB XMP 7700 base. This device helps to ensure that the module and its base are properly matched if disassembled or replaced.
- Sheets of customizing labels: STB XMP 7600
- A cable between the STB EPI 1145 module and the Tego Power block.

(1) RDY is permanently on if the module is operational. If RDY is off, the PDM is not supplying power. If RDY is flashing, the module is not functional.

(2) If ERR is on or flashing, the module has an internal detected error.

For information about module and channel status indication, refer to the System Hardware Components Reference Guide included on the STB SUS 8800 CD-ROM or available on our web site: www.schneider-electric.us.

(3) S1: Output bank 1 (outputs 1 to 4)
S2: Output bank 2 (outputs 5 to 8)

(2) For a set of 8 motor starters, use 2 APP2R4E splitter boxes.

(3) The template for the user-customizable labels is supplied on the documentation mini CD-ROM.

Introduction

Counting parts or events, grouping objects, controlling incoming and outgoing data streams, and measuring lengths or positions all require counting functions.

The STB EHC 3020 counter module performs these functions for a Modicon® STB automation station (controlled by a master connected to the station) with a maximum counting frequency of 40 kHz.

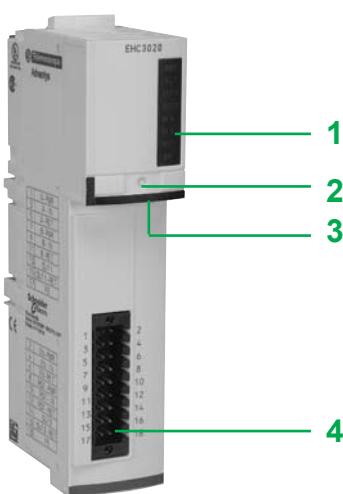

The STB EHC 3020 module, with 1 counter channel, accepts as input typical 24 V--- sensors (proximity sensors, photoelectric sensors, incremental encoders or mechanical contacts) (1). As output, the module features 2 solid-state 24 V--- 0.5 A outputs.

The Advantys™ configuration software is used to select one of the six functions the module can perform.

Description

The front panel of the STB EHC 3020 counter module features:

- 1 A display block with 8 display LEDs:

Indication	Standard STB EHC 3020 module
Module status(2)	Green RDY LED
Module detected error (3)	Red FLT LED
State of the 2 outputs	Green OUT1 and OUT2 LEDs
State of the 2 counter inputs	Green INA and INB LEDs
State of the reset input	Green RST LED
State of the EN enable input	Green EN LED

- 2 Slot for user-customizable labels
- 3 Color-coded module identification stripe (black)
- 4 A connector for an STB XTS 2150 18-pin removable spring-type terminal block (to be ordered separately)

The STB EHC 3020 KC module kit includes:

- STB XBA 3000 base, width 28.1 mm. Includes a slot for user-customizable labels
- STB XTS 2150 18 removable spring-type terminals

To be ordered separately:

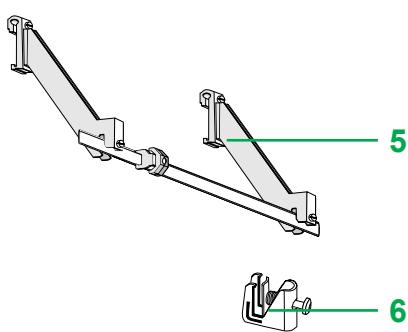

- A grounding kit, recommended for connecting the cable shielding
- 5 STB XSP 3000 grounding kit
- 6 STB XSP 3010 terminal for cables with a cross-section of 1.5 to 6 mm² or STB XSP 3020 terminal for cables with a cross-section of 5 to 11 mm²
- Optional mechanical keying pin between the module and the STB XMP 7700 base. This device helps to ensure that the module and its base are properly matched if disassembled or replaced.
- Sheets of user-customizable labels: STB XMP 7600

(1) The counting frequency is limited to 400 Hz with mechanical contacts.

(2) RDY is permanently on if the module is operational. If RDY is off, the PDM is not supplying power. If RDY is flashing, the module is not functional.

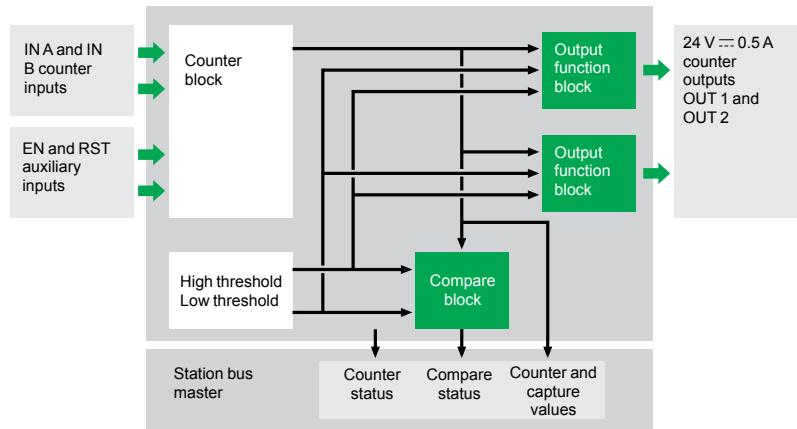

(3) If FLT is on or flashing, the module has a detected internal fault.

For information about module and channel status indication, refer to the System Hardware Components Reference Guide included on the STB SUS 8800 CD-ROM or available on our web site: www.schneider-electric.us.

Operation

Counter channel block diagram

Depending on the counting function used (see functional specifications on page 90), the I/O for the STB EHC 3020 module are assigned to:

- Input IN A, connected to a sensor
- Inputs IN B, EN, and RST, connected to a sensor or activated by the Modicon® STB master via the fieldbus

The 16-bit counter value is compared to the two threshold values (configured with the configuration software) and is used to activate the OUT 1 and OUT 2 outputs without requiring processing by the bus master controller. Reports such as the counting value or the two status bits (counter status, compare status) are sent to the bus master controller.

Functional specifications

Configurable functions	Number	1 of the 6 configurable functions (using the Advantys™ configuration software)
Frequency meter		<p>This basic function measures the frequency received on the IN A input. This frequency is always expressed in hertz (number of pulses per second), with a precision of 1 Hz.</p> <p>Also measures the speed in units per second. The number of points to be received on the IN A input, corresponding to one unit, must be defined from 1 to 255.</p> <p>The maximum frequency on the IN A input is 40 kHz in both cases (without filtering).</p> <p>Response time: < 0.2 s (frequency 2/40 kHz), < 1 s (frequency 0.2 kHz)</p>
Count events		<p>This function provides the value of the number of pulses received on the IN A input per unit of time. The unit of time is configurable: 0.1 s, 1 s, 10 s, or 1 minute.</p> <p>The IN B input can be used to reset the internal time basis that provides the unit of time.</p> <p>The maximum number of pulses counted during a unit of time is up to 65,535.</p> <p>The minimum pulse duration on the IN A input is 10 µs (without filtering).</p> <p>Response time: < 0.5 ms</p>
Measure time periods		<p>Measures the elapsed time during an event or between two events (on the IN A input) according to the selectable time base of 10 µs, 100 µs, or 1 ms. The maximum event duration is 0.655 s, 6.55 s, or 65.5 s, respectively. The maximum frequency on the IN A input is 200 Hz.</p> <p>Response time: < 0.5 ms</p>
Down counting		<p>The IN B input starts or restarts the counter by resetting it to the setpoint value defined by the high threshold value.</p> <p>When the counter is running, any pulse received on the IN A input decreases the counter.</p> <p>The counter stops when it reaches 0.</p> <p>The maximum setpoint value is 65,535.</p> <p>The maximum frequency on the IN A input is 40 kHz (without filtering).</p> <p>Response time: < 0.5 ms</p>
Loop (modulo) counting		<p>The IN B input starts or restarts the counter by resetting it to 0. The IN B input also captures the previous counting value before the counter is reset to 0.</p> <p>When the counter is running, any pulse received on the IN A input increases the counter.</p> <p>The counter turns back to zero automatically when the pulse number received equals the modulo defined by the high threshold value.</p> <p>The maximum modulo value is 65,535.</p> <p>The maximum frequency on the IN A input is 40 kHz (without filtering).</p> <p>Response time: < 0.5 ms</p>
Up/down counting		<p>The RST input starts or restarts the counter by resetting it to the preset value.</p> <p>When the counter is running, counting increases or decreases according to the pulses received on the IN A and IN B inputs (by default, IN A increases the counter and IN B decreases the counter).</p> <p>By configuration:</p> <ul style="list-style-type: none"> <input type="checkbox"/> Input IN B can define the counting direction of the pulses received on IN A. <input type="checkbox"/> Inputs IN A and IN B can receive signals from an incremental encoder. <p>The counter value is limited to a low limit of 0 and a high limit of 65,535.</p> <p>Response time: < 5 ms</p>
OUT1 and OUT2 output functions		<p>According to the requirements, each of the counter module's two outputs can be configured for one of the following operating modes:</p> <ul style="list-style-type: none"> <input type="checkbox"/> No direct action <input type="checkbox"/> The output is activated when the counter value is less than the low threshold. <input type="checkbox"/> The output is activated when the counter value is between the low threshold and the high threshold. <input type="checkbox"/> The output is activated when the counter value is greater than the high threshold. <input type="checkbox"/> A pulse is generated on the output when the down-counter passes the low threshold. <input type="checkbox"/> A pulse is generated on the output when the up-counter passes the low threshold. <input type="checkbox"/> A pulse is generated on the output when the down-counter passes the high threshold. <input type="checkbox"/> A pulse is generated on the output when the up-counter passes the high threshold. <input type="checkbox"/> The output is activated when the counter is placed in RUN mode. This option is only available for the down-counter function. <input type="checkbox"/> The output is activated when the counter is placed in STOP mode. <input type="checkbox"/> The output is activated when the captured value is less than the low threshold. This option is only available for the modulo function. <input type="checkbox"/> The output is activated when the captured value is between the low threshold and the high threshold. This option is only available for the modulo function.

Specifications

Electrical specifications

Module type		STB EHC 3020	
Frequency on counter inputs		kHz	1 channel, 40 max. (1) (1) Use of grounding kit is mandatory for counting at 40 kHz.
Swapping	Cold swap		Yes
	Hot swap		Yes, depending on NIM and mandatory specification of module. See table on page 43.
Mounting base		STB XBA 3000	
Power Distribution Module (PDM) required	Voltage provided	V	24
	Reference		STB PDT 3100/3105
Operating temperature, horizontal mounting		°C (°F)	-25 to 70 (-13 to 158)
Consumption on the logic 5 V bus		mA	100
Isolation	Between station bus and I/O	V	500

Input specifications

Input type		Counter inputs (IN A and IN B)		Auxiliary inputs (RST and EN)
Nominal values	Voltage	V	24 (range 19.2 to 30 V)	
	Current	mA	6	
Limit values		At state 1 11 to 30 V, current 2 mA, minimum (at 11 V)		
At state 0		-3 to 5 V, current 1.5 mA, maximum		
Logic		Positive		
Filter time	Analog	μs	2.5	25
	Digital	ms	None (max. count 40 kHz) 0.40 (max. count 1 kHz) 1.20 (max. count 400 Hz)	-

Output specifications

Output type		Outputs OUT 1 and OUT 2	
Nominal voltage	V	24 (range 19.2 to 30 V)	
Nominal current	A	0.5 (1 A per module)	
Logic	Positive (by default), positive on 1 or 2 channels, negative on 1 or 2 channels (configurable)		
Response time	See functional specifications on page 90.		
Leakage current	At state 0	mA	0.1 maximum
Voltage drop	At state 1	V	3 maximum
Maximum load inductance		Henry	0.5 at 4 Hz or $L = 0.5/I^2 \times F$ where L: load inductance, I: load-in current, and F: switching frequency
Short-circuit and overload protection	Type per channel		By current limiter (1.1 A, typical/1.5 A, maximum) and electronic tripping (manual or automatic reset)
Default fallback positions	Default		Set to state 0 for both channels
	Configured		Hold last value, set to state 0 or 1 for each channel

(1) Use of grounding kit is mandatory for counting at 40 kHz.

Modicon® STB distributed I/O solution

Configuration and debugging software

Introduction

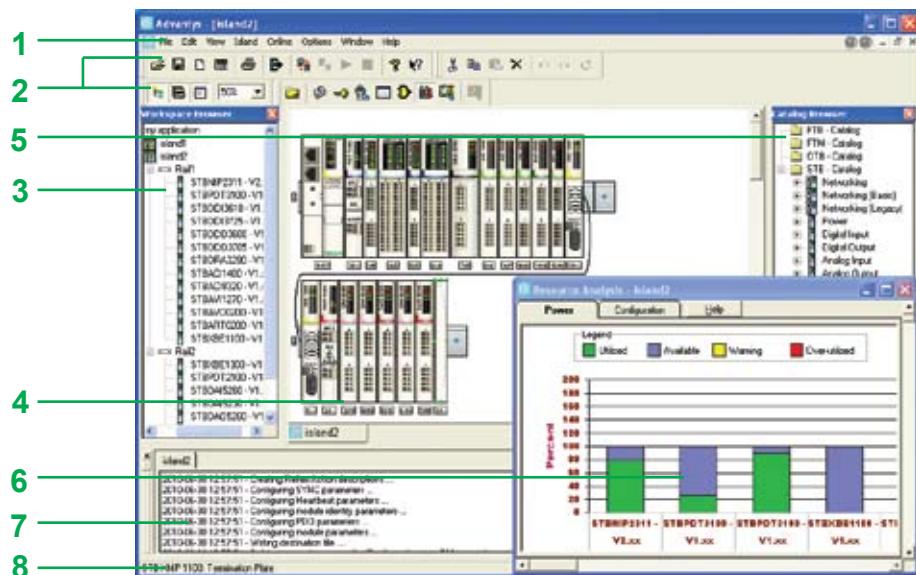

Advantys™ STB SPU 1••• software is the configuration and debugging tool for the Modicon STB, OTB (IP20 protection) and FTB/FTM (IP67 protection) range of distributed I/O solutions. It also enables debugging and diagnostics of distributed I/O stations during operation.

With respect to the Modicon STB range, the Advantys STB SPU 1••• software can be used to:

- Define I/O modules making up a Modicon STB automation station
- Configure standard modules (Basic modules have a permanent default configuration.)
- Configure the reflex functions handled at the station level
- Optimize station performance by assigning priorities for the processing of certain modules
- Designate mandatory modules; for example, modules that must be present and functioning correctly for the station to operate correctly
- Declare external CANopen devices in the station. These include Modicon FTB IP67 monobloc I/O splitter boxes; electropneumatic valves by Festo®, Parker®, and Bosch; ATV 31/312/61/71 variable speed drives; Balluff® linear encoders; Osicoder absolute rotary encoders; other CANopen V4.0 devices.
- Check the configuration for compliance and power consumption (also available for basic network interface modules)

User interface

The main screen of the Advantys configuration and debugging software provides easy, intuitive access to available tools.

This main screen is a general view of several windows and toolbars that can be moved about the screen:

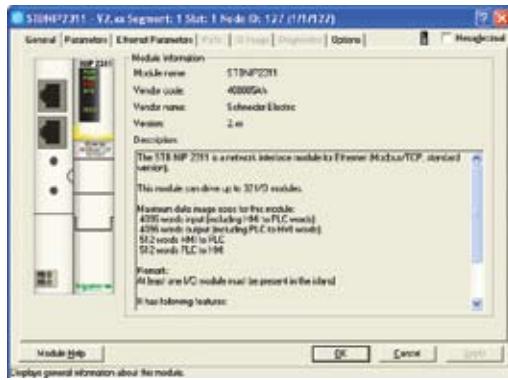

- 1 Menu bar, providing access to functions
- 2 Toolbar, containing icons for direct access to editors and the most frequently used functions
- 3 Application browser, for navigating to the various stations and segments of each station
- 4 Main window, for viewing stations and segments
 - By selecting a module, you can access the appropriate editors:
 - Module editor
 - Reflex action editor
 - User defined label editor
 - Field power supply, logic power supply and I/O & HMI image area resource analysis
 - Overview of the I/O image
 - I/O image animation
 - Diagnostics

The last two items are available only if the station is in online mode.

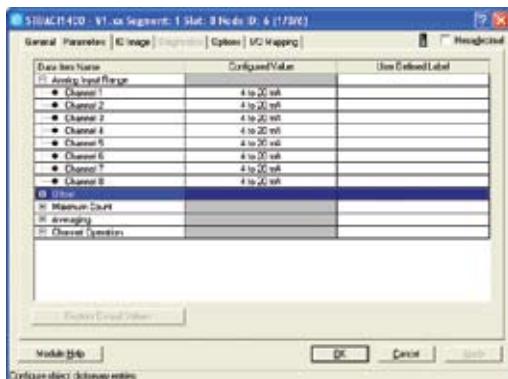

- 5 Catalog browser for Modicon STB components, sorted by category (networks, power supply, digital I/O, etc.)
- 6 Field power supply, logic power supply and I/O & HMI image area resource analysis window
- 7 Log window displaying the results of operations performed by the configuration software during a work session on a station
- 8 Status bar

Dual-port Ethernet Modbus/TCP NIM

STB ACI 1400 module with 8 analog input channels

Dual-port Ethernet Modbus/TCP NIM

"I/O Image" tab

Functions

Module editor

The editor provides access to between 5 and 7 tabs, depending on the module types and whether the station is connected to the network or fieldbus. The basic tabs are: General, Parameters, I/O Image, Diagnostics and Options.

"General" tab

This read-only tab (station online or offline) provides general information and displays the main technical specifications of the selected module.

"Parameters" tab

This tab, accessible when the station is offline, contains the operating parameters for the selected module. Some parameters can be changed by the user. Among other things, you can:

- Select the display format for parameters: decimal or hexadecimal.
- Assign user label: free text field for up to 50 characters (1)
- Configure modules: the type of I/O module determines which items can be configured (items in cells with white backgrounds). Depending on the type of module, the main parameters are:
 - Digital input modules: filter time and choice of positive or negative logic for each channel
 - Digital output modules: the behavior upon short circuit or overload (manual or automatic reset), the choice of positive or negative logic for each channel, the default fallback position for each channel (0 or 1 state)
 - Analog input modules: with the operating range, the offset, the maximum count, the filtering average and the channel operation (Enable/Disable) for each channel
 - Analog output modules: with the data format, the output range, the channel operation (Enable/Disable), and the default fallback value (hold last value or assume a predefined value) for each channel
 - Application-specific modules: for TeSys® motor starters, model U or TeSys Quickfit, the choice of positive or negative logic for each channel, the behavior upon output short circuit or overload (manual or automatic reset), and the default fallback position for each channel (0 or 1 state)
 - Counter module: the definition of the counting function and its operation (see page 89)
 - Network interface modules: the amount of memory reserved for data exchanges with the HMI terminal (directly connected to the network interface module). This data can also be accessed by the station master: If a Modicon STB station has a CANopen extension, a parameter allows you to define the address of the last standard CANopen device connected to the station.

You can access the online help for the selected module to learn about the limit values and the operation of these parameters.

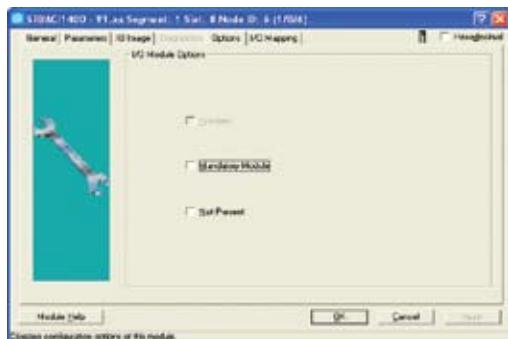

"I/O Image" tab

This tab allows you to read and modify the I/O data of a module when the island is online. You can also write a customize label for any of the data items listed on the I/O Image tab. This feature allows you to pre-symbolize important memory locations in the Island before the application is written.

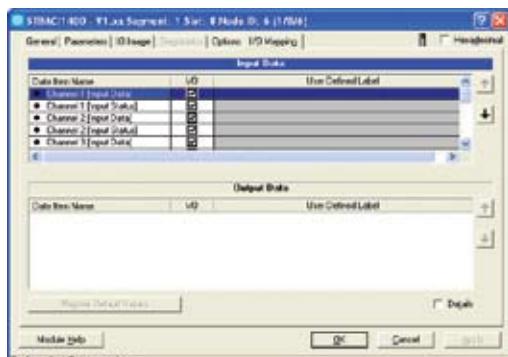

(1) A utility is available to enable the export of user labels (under CANopen) to the memory of Premium™ PLCs (under Unity Pro™ or PL7™ software). Please consult your Regional Sales Office.

Modicon® STB distributed I/O solution

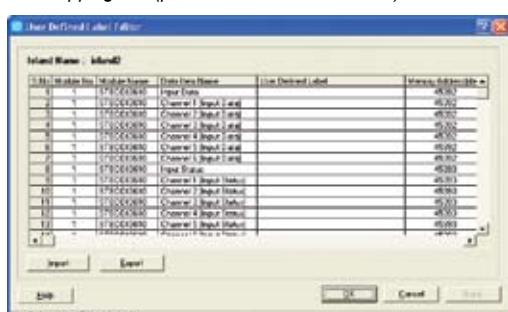

Configuration and debugging software

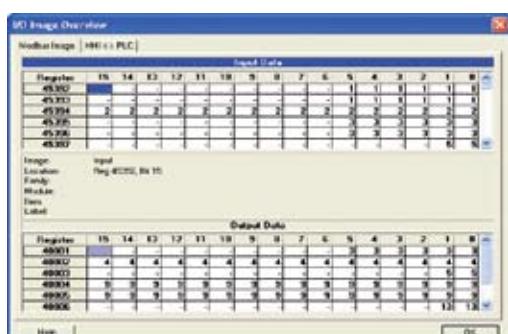

"Options" tab

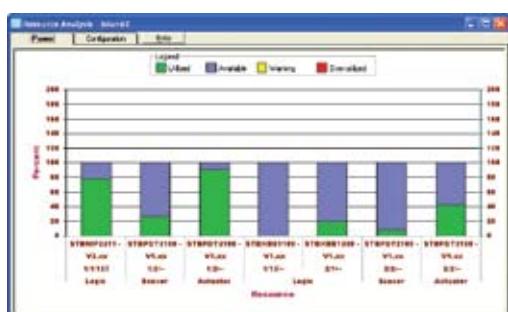

"I/O Mapping" tab (part of the standard modules)

User Defined Label Editor

IO Image Overview

Power supply and memory resource analysis

Functions (continued)

"Diagnostics" tab

This tab allows the user to perform diagnostics for the station connected to the PC terminal where the Advantys™ configuration and debugging software resides.

"Options" tab

This tab, accessible when the island is offline, provides the user with options to configure I/O or network interface module.

- Prioritize the selected I/O module in a group of fast-solve modules that are scanned by the NIM more frequently than other modules. By default, the software automatically prioritizes the first 10 prioritizable modules. If the island consists of more than 10 prioritizable modules, you must prioritize the modules manually.
- Designate the selected I/O module as mandatory. If a mandatory module fails or is removed from the Island, the entire Island bus will switch to pre-operational mode and stop. It will return to its operational state only if you reinstall the same functional module, or a new module of the same type, at this exact location on the bus.
- Mark the selected I/O module as Virtual Placeholder. The Virtual Placeholder allows you to remove certain physical Island I/O modules from a base configuration while keeping the identical process image. Thus, you can define an Island with various options removed without changing the PLC program which controls the Island.
- Configure run-time parameters (on network interface module), this reserves a set of registers in the fieldbus image. These registers allow the user to control the transfer of parameters at application program level using normal I/O operations. These registers are indicated in the I/O Image as RTP.
- Set maximum node ID on the CANopen extension (on network interface).

"I/O Mapping" tab (part of the standard modules)

You can edit the I/O mapping of the selected module using the I/O Mapping tab in the Module Editor. This dynamic I/O mapping allows you to optimize the Island's process image on a module-by-module basis.

User Defined Label Editor

This tab allows you to assign user labels in a single editor to all module data items on the island.

This editor enable the import/export of user labels in CSV format.

I/O Image Overview

It provides a utility with an overview of the I/O data and status allocation for all modules on the Island. It also gives you a view of any data that may be written to the Island bus or read by the fieldbus master. It contains Fieldbus Image tab containing the fieldbus view and Modbus Image tab containing the Modbus view depending on the network interface type. Each view has input and output table.

Analysis of the station memory and power supply resources

At any time during the configuration process, you can view the following information expressed as a percentage:

- Power consumption at various voltages:
 - 5 V --- logic voltage supplied by the STB N● network interface module
 - 5 V --- logic voltage supplied by the STB XBE 1200/1300 BOS bus extension module
 - 5 V --- logic voltage supplied by the STB CPS 2111 auxiliary power supply module, this module should be associated with an STB PDT ●10● power supply module.
 - 24 V --- voltages supplied by the STB PDT 3100/3105 power distribution module(s)
 - 115/230 V ~ voltages supplied by the STB PDT 2100/2105 power distribution module(s)
- Usage of the memory built into the network interface module:
 - Image field for inputs and outputs
 - Field dedicated to the human machine interface

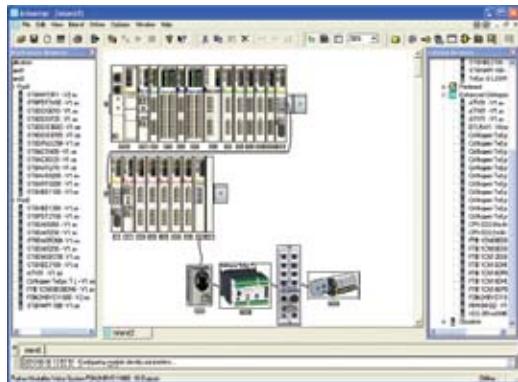

Downloading of configuration data

The software enables bi-directional transfer of configuration data:

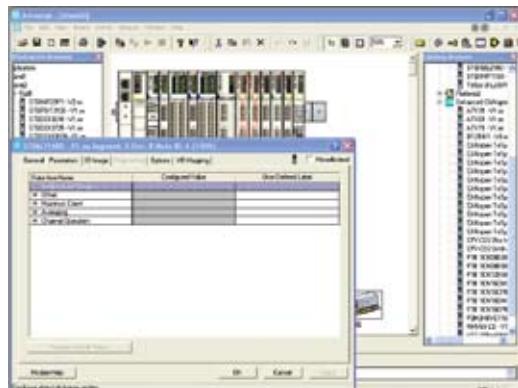

- From the PC to the RAM and Flash memory of the station network interface module in order to make the station operational. If the network interface module includes the STB XMP 4440 32 KB removable memory card, data will be written to the card, providing a backup.
- From the station network interface module to the PC

Modicon® STB distributed I/O solution

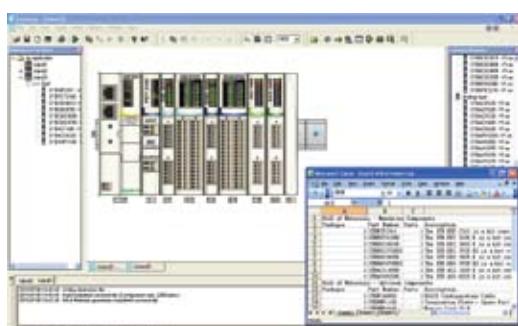

Configuration and debugging software

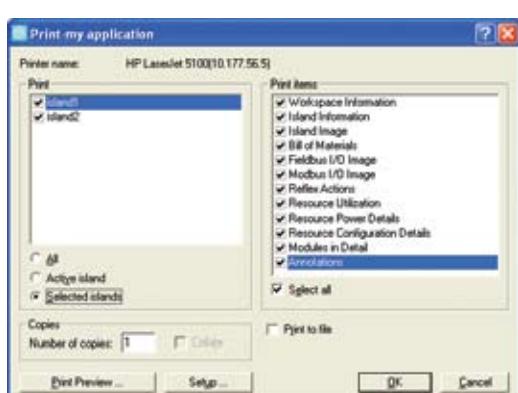

Access via RTP to external components such as
ATV variable speed drives, etc.

"Absent" modules will actually be installed as needed.

Bill of Materials

Printing: Selection of stations and elements to be inserted in
the design report

Functions (continued)

RTP run-time parameters

The RTP (*Run-Time Parameters*) function enables access from the PLC to data (1) of the external CANopen components connected to an STB station.

The main uses are:

- Writing the parameters of a component: Inoperative Device Replacement (IDR) operation
- Reading the variables for the monitoring and diagnostics of any object connected to the station

"Absent" modules

This function of the Advantys STB SPU 1000 configuration and debugging software allows you to declare I/O modules that will not actually be included in the station at the outset. This means that:

- "Virtual" module slots are reserved in the station configuration.
- The exchange data of the "virtual" modules are included in tables of exchanges with the PLC.

The physical modules can be integrated into the automation station as actual requirements increase.

Export of user labels ("tags")

The Advantys™ software allows you to create tags (symbol names) for objects and I/O parameters of the Modicon STB configuration, including external devices connected to the CANopen bus.

The "File/export" function exports these names at the same time as the mapping, regardless of the fieldbus or network used. This information can be used directly on controllers. This eliminates the need to declare I/O objects again and promotes consistency in the naming of machinery or equipment.

User labels can be exported in CSV format.

Import/export of station mapping files

This function allows you to carry out mapping and export it in the format of any PLC programming software, regardless of the fieldbus or network.

Bill of Materials

The Bill of Materials provides the description of a selected island including mandatory and optional components. In addition to getting a printout of the Bill of Materials using the Print function, the information for the Bill of Materials can be exported to a CSV file. It is possible to customize the output of the Bill of Materials according to your preferred:

- Calculation algorithm (based on kits or individual parts)
- Amount of module information
- Type of connectors (spring or screw)
- Extension cable length selection

The default type of connectors is the screw type.

Design report printout

This function allows you to select topics to be sent to a printer or to a PDF or editable RTF file. The following items can be selected:

- Graphic image of the station
- Any portion of the station information:
 - List of mandatory components, including accessories, such as bases, connectors, etc.
 - List of optional components, such as labels, keying pins, memory cards, etc.
 - Information about the workspace
 - Information about the station
 - Image of the station
 - List of components
 - Fieldbus I/O image
 - Modbus I/O image
 - Reflex actions
 - Resource usage
 - Resource power supply details
 - Resource configuration details
 - Module details
 - Notes

(1) Data: Configuration and adjustment parameters and variables

Functions (continued)

Test mode

There are two test modes:

- PLC offline test: Bus or network communication is disconnected. The outputs can be controlled directly from the Advantys application connected via the Modbus® port on the network interface module.
- Online test: Bus or network communication is operational. The outputs can be forced directly from the Advantys application. This mode can be accessed by entering a configurable password.

These test modes allow you to import the station configuration and read the error messages and I/O states.

Update at: www.schneider-electric.us

The Advantys STB SPU 1000 configuration and debugging software and the databases of its module catalog are available on our web site:

www.schneider-electric.us. From the web site, you can:

- Download the Advantys STB SPU 1000 software application for a free 21-day trial
- For officially registered software, obtain function updates and updates for the catalog of components that can be connected to Modicon STB automation stations

Reflex functions editor

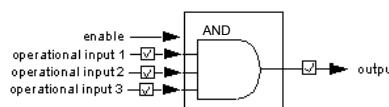

For applications requiring short response times (< 3 ms), the Modicon® STB distributed I/O solution allows you to create reflex functions using the configuration and debugging software. These reflex functions act directly at the level of the station output modules and therefore are not taken into account or processed by the station master. These reflex functions can be associated with "priority" I/O modules to help ensure reliable response times.

A Modicon STB station can call up to 10 reflex functions. These functions are created from blocks whose inputs are activated by digital or analog input channels and whose results activate a digital or analog output channel. You can nest two reflex functions.

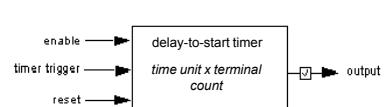

Reflex types and function blocks

Various types of function blocks are available:

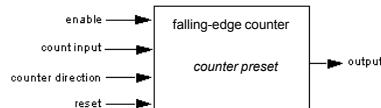

Boolean logic blocks: XOR block, AND blocks with 4 inputs and 1 output

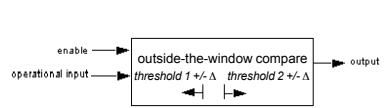

Timer/monostable blocks: when working, when idle, upon activation and upon deactivation

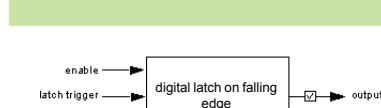

Up/down counter blocks: on a rising or falling edge, from 0 to 65,535

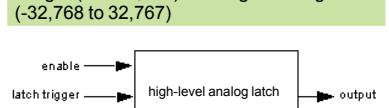

Comparison blocks on signed integers (-32,768 to 32,767): i <, i >, < i >, i <, and i >

Digital latch blocks: on state 0 or 1 or on rising or falling edge, storing of state 0 or 1

Analog latch blocks: on state 0 or 1 or on rising or falling edge, storing of signed integer (0 to 65,535) or unsigned integer (-32,768 to 32,767)

Documentation: A document entitled "Reflex actions" is available on the STB SUS 8800 CD-ROM and on our web site: www.schneider-electric.us.

Trial period

For STB SPU 1•••, you must register the software with Schneider Electric within 21 days to obtain permanent user rights.

During the trial period of 21 days, all services are available. Once the trial period has expired, online services are not available anymore without registration. All other product families have full functionality.

Custom user registration

Custom user registration can be accessed free-of-charge online, via e-mail, fax, or telephone for pack types from the single-station version to the site version. This allows you to receive customized updates within your company.

Modicon® STB distributed I/O solution

Momentum™ PLC 171 CBB 970 30 processor
Open and modular system

171 CBB 970 30

Introduction

The Momentum™ 171 CBB 970 30 processor integrates both a full programmable controller, an Ethernet switch with 4 x 10/100 Mbps ports, and a Modbus® serial communication port. Supporting a wide temperature range from -20 to 70°C (-4 to 158°F), and powered with 24 V DC, it also has a realtime clock and a battery for backing up the memory.

Processor

- 0.25 ms/Kinstructions
- Concept™ software IEC 61131-1 and ProWORX™ software 32 LL984
- Realtime control using Ethernet:
 - Distributed I/O connectivity
 - Peer-to-peer interprocessor communication
 - Realtime clock
 - Battery for backing up data
 - 19.2 to 42.5 V DC power supply

Communication

- Integrated Ethernet switch with 4 ports
- 10/100 Mbps, half/full duplex autonegotiated
- RS232/RS485 Modbus serial communication port
- Simple menu-driven configuration

This integration results in:

- A reduction in the number of components required, simplification of the wiring, lower setup costs
- Unrivalled flexibility in designing system architectures: the Momentum 171 CBB 970 30 processor's compact dimensions make it ideal for installation where space is limited or in small machines
- Direct high-performance Ethernet connectivity to the I/O, other control systems and HMI terminals
- Faster response times on high-traffic networks thanks to its half/full duplex communication with autonegotiation
- Setup made easy by simple menu-driven configuration

Applications

Ethernet 10/100 Mbps communication supports the Modbus TCP/IP protocol, offering connectivity to the distributed I/O and host systems, communication with other peer processors, drives, operator and programming terminals, as well as simple browser access to embedded web pages.

The Modbus serial communication port can be used to connect the processor to any RS232 or RS485 device in master or slave mode.

The processor program can be expressed in one of the five IEC 61131-1 languages in the Concept environment or as a ProWorX 32 Ladder 984 logic diagram.

These capacities make it the ideal processor for distributed I/O and device systems on Ethernet; for example, intelligent sub-system connected to a master or supervision processor, multiprocessor distributed processing applications, etc. The Momentum 171 CBB 970 30 processor is suitable for a wide variety of applications:

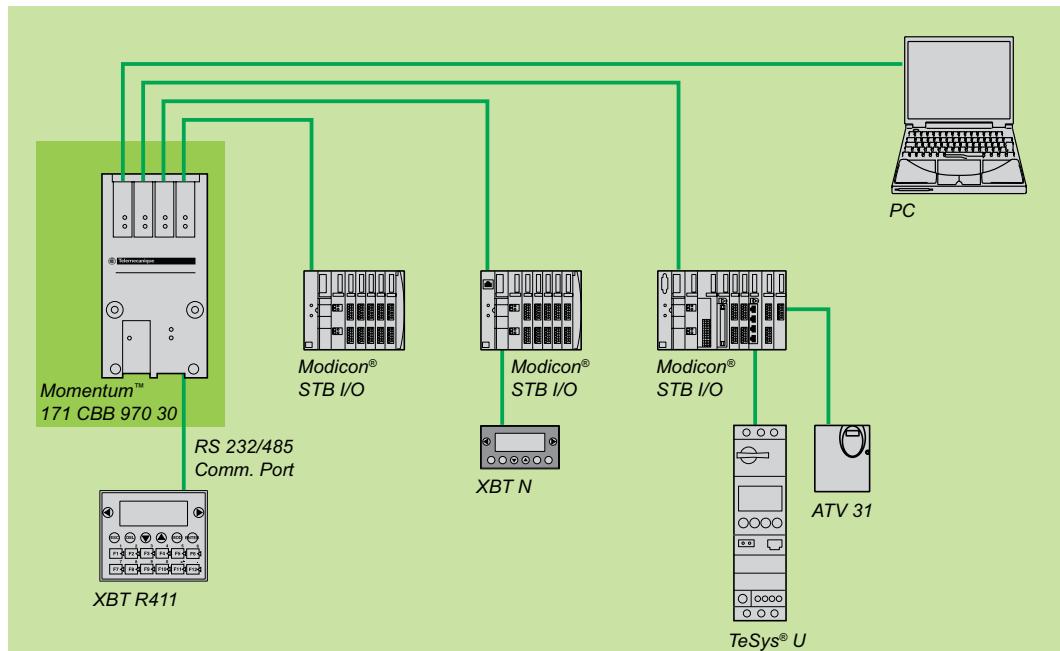

- Conveying, handling
- Packaging
- Water/waste treatment
- Infrastructure
- Pumping, RTU, heating, air conditioning
- Batch/process control
- Data acquisition, monitoring

Modicon® STB distributed I/O solution

Momentum™ PLC 171 CBB 970 30 processor
Open and modular system

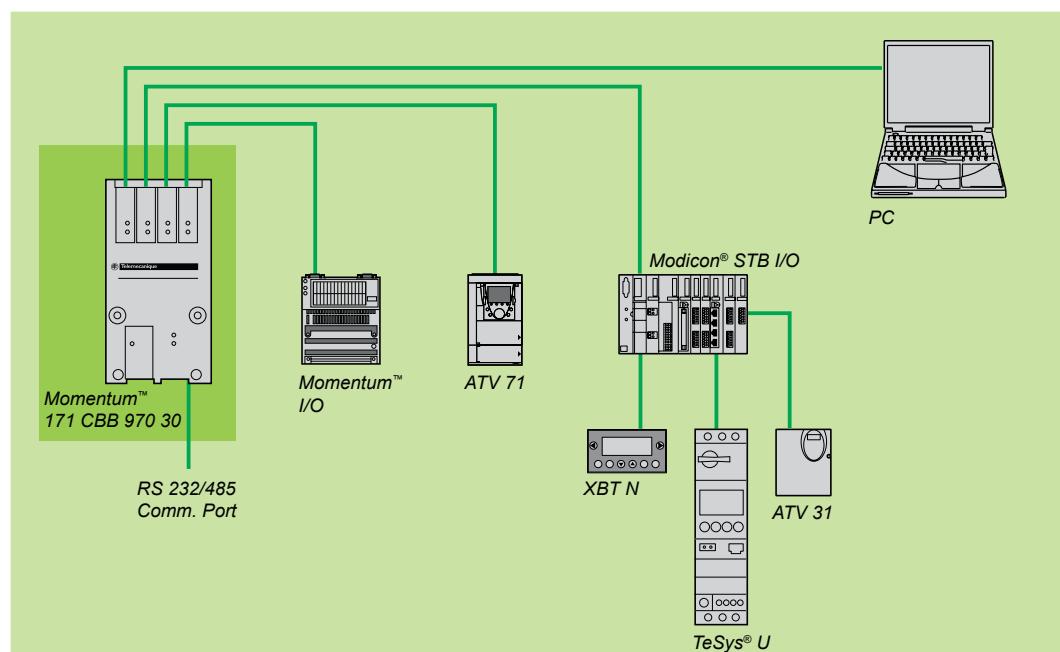

Configuration

Single-processor processing system with 3 I/O lines

The system can include up to 3 Momentum™ or Modicon® STB I/O stations.

Single-processor processing system with distributed devices

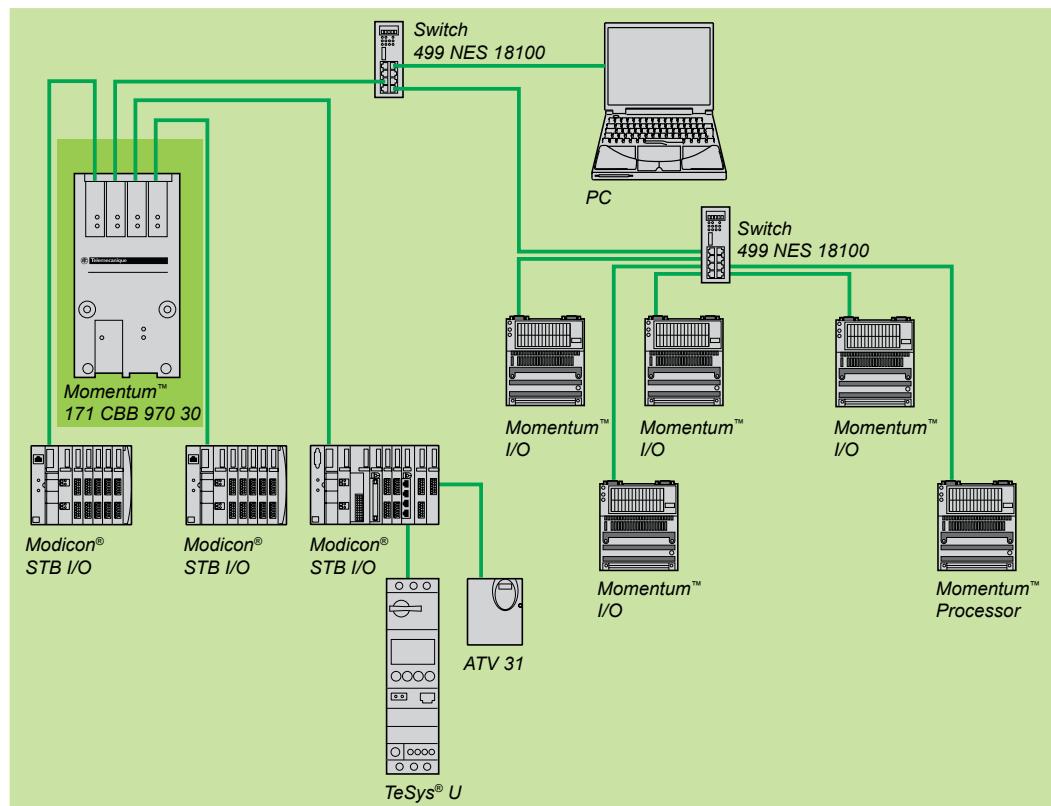

Modicon® STB distributed I/O solution

Momentum™ PLC 171 CBB 970 30 processor
Open and modular system

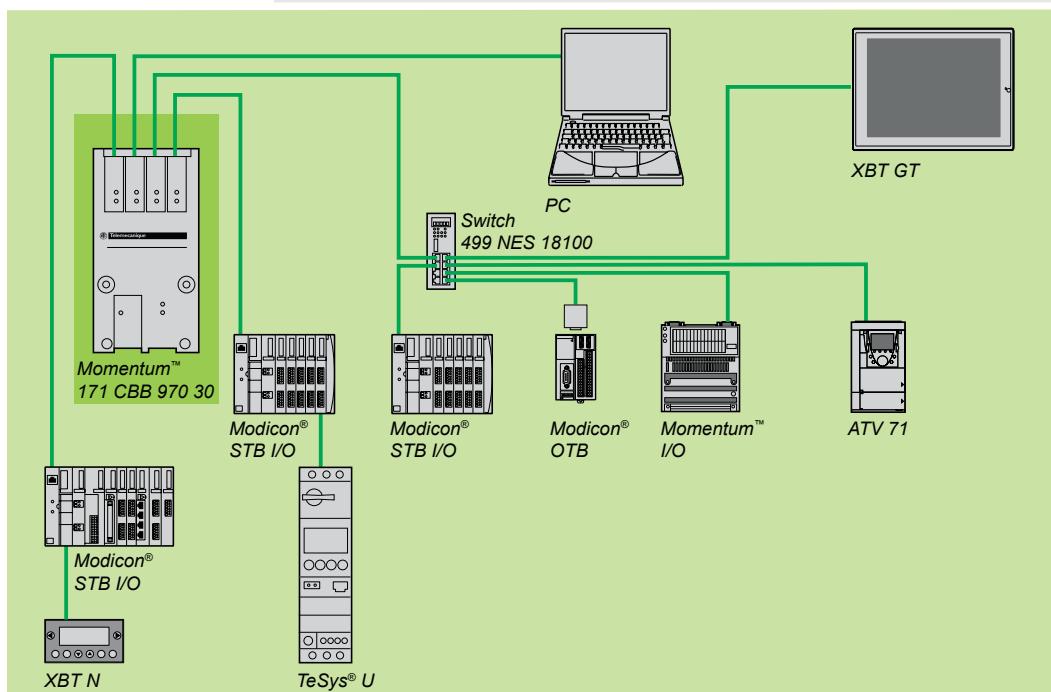

Configuration (continued)

Multiprocessor decentralized processing system

The system can include an existing M1E processor.
Up to 14 processors in *peer-to-peer* communication.

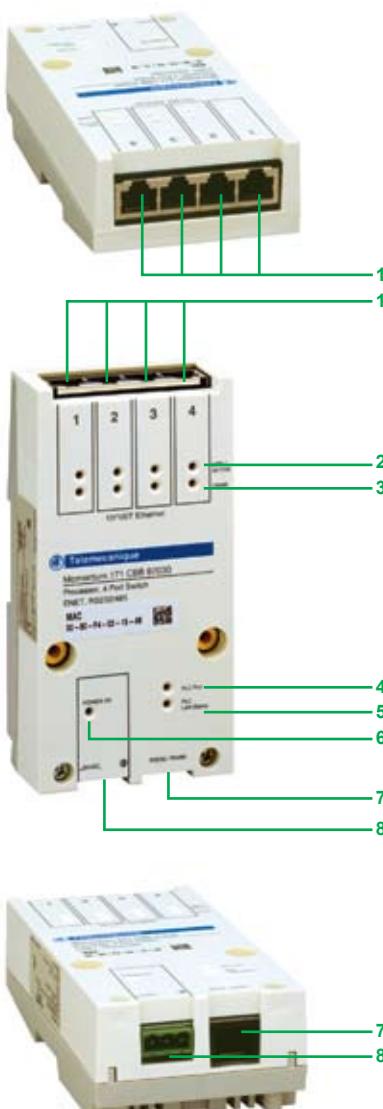

Processing system extended by a second Ethernet switch

Extending the Ethernet network allows additional devices to be connected.

Modicon® STB distributed I/O solution

Momentum™ PLC 171 CBB 970 30 processor
Open and modular system

Description

- 1 4 RJ45 10/100 Mbps Ethernet ports
- 2 4 Ethernet activity LEDs
- 3 4 100 Mbps speed indicator LEDs
- 4 1 processor running status LED
- 5 1 LAN status LED
- 6 1 24 V power supply status LED
- 7 RS232/RS485 Modbus® serial link port
- 8 24 V power supply connector

Web server

A PC equipped with a browser is what you need to access the Web server hosted by the Momentum™ 171 CBB 970 30 processor and its 4 pages of information updated in real time:

- Processor home page
- Processor configuration, system status
- Ethernet transmission/reception statistics
- Links to Schneider Electric web sites

Device configuration

The *Ethernet I/O scanner* software provides a simple, menu-driven way of configuring Momentum 171 CBB 970 30 processor communication with the I/O devices connected to it:

- IP address
- Timeout and transaction repetition rate
- Address of the first processor register where data is to be read/written
- Length of exchanges in number of words
- *Ethernet I/O scanner* is included in both Concept™ and ProWORX™ software.

Modicon® STB distributed I/O solution

Combination with Magelis® display units and HMI terminals

STB NCO 2212 (cover open) and
STB XCA 4002 cable

Application

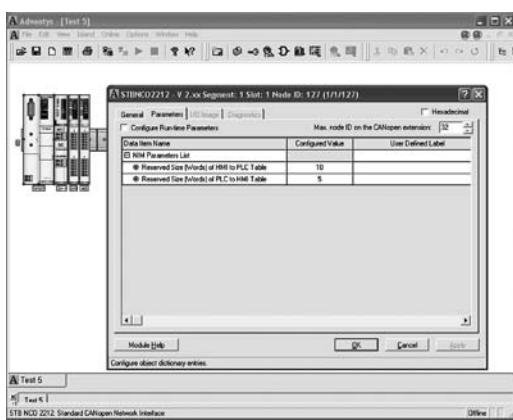

A Magelis® XBT terminal or display unit can be connected directly to a Modicon® STB station via the Modbus programming port.

PLC

Modicon STB distributed I/O station with standard NIM communication module STB NCO 2212

Modbus® serial cable and adaptor if required (see compatibility table on next page)
Magelis XBT display unit or HMI terminal

Configuring the exchange memory size with
Advantys STB SPU 1000 software

Functions

With this architecture, the XBT terminal or display unit is the Modbus serial link master; the Modicon STB standard communication module is the slave.

The connection allows:

- 1 Data transfer between the Magelis XBT terminal and the PLC via the exchange area defined by the user in the Modicon STB memory. Two word tables have to be configured (sizes, labels) in the memory of the NIM communication module using the Advantys® STB SPU 1000 configuration software:
 - One written by the terminal and read by the PLC (HMI->PLC)
 - The other written by the PLC and read by the terminal (PLC->HMI)
 The Modicon STB distributed I/O station is used as a neutral gateway between the PLC and the terminal.
The terminal can display information coming from the PLCs and, conversely, control automatic functions in the normal way.
- 2 Display of the following Modicon STB data on the Magelis terminal:
 - Input and output values
 - Internal states
- 3 When the Modicon STB is in "Test" mode, writing of the station's output values

Note: Functions 2 and 3 :

- Do not require communication to be established between the PLC and the Modicon STB station
- Cannot be performed simultaneously

Modicon® STB distributed I/O solution

High-density I/O modules
and the Modicon Telefast® ABE 7 pre-wired system

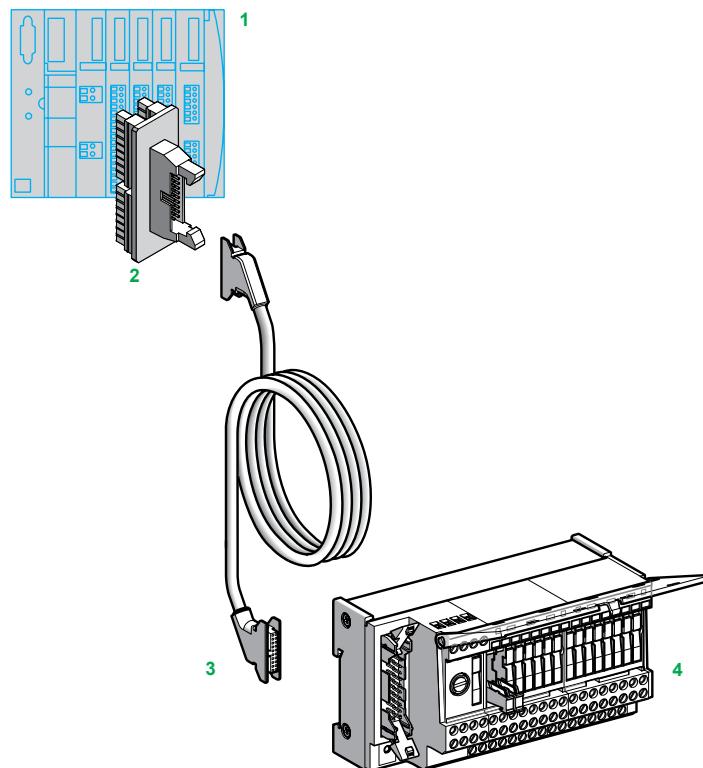

Application

Using the Modicon® Telefast® ABE 7 pre-wired system rationalizes and simplifies enclosure wiring.

Far less space is required in the enclosure and the Modicon Telefast ABE 7 base replaces the connection terminals at the bottom of the enclosure.

Designed for the 16-way high-density modules STB DDI 3725 and STB DDO 3705, Modicon Telefast ABE7 HE10 connectors offer a simple wiring solution simple when combined with standard Telefast cables, Modicon Telefast ABE7 blocks and Twido Telefast blocks for the following voltages:

- 24 V ...
- 48 V ... and 48 V ~
- 110 V ~
- 230 V ~

- 1 Modicon STB I/O station incorporating an STB DDI 3725 and/or STB DDO 3705 high-density module
- 2 STB XTS 5•10 (DDI) or STB XTS 6•90 (DDO) HE10 connector
- 3 TSX CDP•02 rolled ribbon cable (100 mA max.) or TSX CDP•03 connection cable (500 mA max.) equipped with two 20-way HE10 connectors.
- 4 Modicon Telefast ABE 7 connector or adaptor base

Examples of cables available (non-exhaustive list):

TSX CDP053	TSX CDP103
TSX CDP203	TSX CDP303
TSX CDP503	TSX CDP102
TSX CDP202	TSX CDP302

 Compatible
 Not compatible

The Modicon STB module can supply 24 V \square power to the Modicon Telefast block provided the current does not exceed 50 mA per group of 4 channels. Otherwise an external power supply will be required and only the 0 V reference should be connected between the Modicon STB module and the Modicon Telefast ABE 7 block.

(1) Sold in pairs (2 connectors per module).

Phaseo® regulated power supplies

ABL 7 power supplies

The ABL 7 range of power supplies is designed to provide the DC voltage required by the control circuits of automation system equipment. Split into three families, this range meets the needs encountered in industrial, commercial and residential applications. Single-phase or 3-phase (1), of the electronic switch mode type, they provide an output current quality that is suitable for the loads supplied and compatible with the line supply available in the equipment. Clear guidelines are given for selecting the protective devices that are often used with them, thus providing a comprehensive solution.

Phaseo® switch mode power supplies

These switch mode power supplies are totally electronic and regulated. The use of electronics makes it possible to significantly improve the performance of these power supplies. The power supplies provide the following features:

- Very compact size
- Integrated overload, short-circuit, overvoltage and undervoltage protection
- Very wide range of permissible input voltages, without any adjustment required
- High degree of output voltage stability
- High efficiency
- LED indicators on the front panel

2/3 A power supply

5 A power supply

10 A power supply

Phaseo power supplies are available in single-phase and 3-phase versions (1). They deliver a voltage that is accurate to 3%, whatever the load and whatever the type of line supply, within a range of 85 to 264 V for single-phase or 360 to 550 V for 3-phase. Conforming to IEC standards and UL- and CSA-certified, they are suitable for universal use. The inclusion of overload and short-circuit protection makes downstream protection unnecessary if discrimination is not required.

ABL 7 RE and ABL 7 RP supplies are also equipped with an output undervoltage control that causes the product to trip if the output voltage drops below 19 V to help ensure that the voltage delivered is always usable by the actuators being supplied. Products are equipped with an output voltage adjustment potentiometer to compensate for any line voltage drops in installations with long cable runs. These power supplies are designed for direct mounting on 35 mm and 75 mm \square rails.

The single-phase power supplies referenced in this catalog are specially adapted for use with the Modicon® STB modules for automation stations (network interface modules and power distribution modules).

■ ABL 7RE universal single-phase supplies:

- Power between 48 W (2 A) and 240 W (10 A)
- Compact size
- For machine equipment
- Suitable for use in automation system environments based on any Modicon® PLC platforms requiring a 24 V \square supply

■ ABL 7RP universal single-phase supplies:

- Power between 60 W (2.5 A) and 240 W (10 A)
- Output voltage available: 12, 24, and 48 V \square
- Input filter (PFC) for commercial and residential environments (conforming to standard EN 61000-3-2)
- Two operating modes possible for handling of overloads and short circuits:
"AUTO" mode provides automatic restarting of the power supply on elimination of the detected fault
"MANU" mode requires manual resetting of the power supply to restart. Resetting is achieved by switching off the line supply power.

(1) For 3-phase power supplies, refer to the Automation & Control - Interfaces, I/O Splitter Boxes, and Power Supplies catalog.

Use of 24 V ...

- The use of 24 V ... enables protected installations (PELV) to be implemented. PELV includes a protective measure against direct and indirect contact with dangerous voltage. Specifications relating to these installations are defined in publication NF C 12-201 and in standard IEC 364-4-41.
 - The application of these measures to the electrical equipment in machines is defined in standard NF EN 60204-1 with the following requirements:
 - The voltage used must be less than 60 V DC in dry environments and 30 V DC in damp environments
 - One side of the PELV circuit, or one point of the source, must be connected to the equipotential protection circuit associated with higher voltages.
 - Switchgear and control gear designed to help ensure a sufficient separation between power circuits and control circuits must be used.
 - PELV circuits require a sufficient separation between the power circuits and the control circuits. This sufficient separation is designed to prevent the development of hazardous voltages in 24 V ... safety circuits.
 - The relevant reference standards are:
 - IEC 61558-2-6 and EN 61558-2-6 (safety transformers)
 - IEC 664 (isolation coordination)Schneider-electric power supplies meet these requirements.
 - Moreover, to help ensure that these products will operate correctly with respect to the reinforced isolation requirements, it is recommended that they be mounted and wired as indicated below:
 - They should be placed on a grounded mounting plate or rail.
 - They should be connected using flexible cables, with a maximum of two wires per connection, and tightened to the nominal torque.
 - Conductors of the correct insulation class must be used.
 - If the DC circuit is not connected to an equipotential protection conductor, an earth ground leakage detector will indicate any accidental insulation faults (please consult your Regional Sales Office).

Operating voltage

- The permissible tolerances for the operating voltage are listed in publications IEC 1131-2 and DIN 19240.
- For nominal voltage $U_n = 24 \text{ V } ...$, the extreme operating values must fall between -15% to +20% of U_n , whatever the supply fluctuations in the range of -10% to +6% (as defined by standard IEC 38) and load variations in the range 0-100% of I_n .
- Schneider-electric 24 V ... power supplies are designed to provide a voltage within this range.
- It may be necessary to use a voltage measurement relay to detect when the normal voltage limits are being exceeded and to deal with the consequences of this (please consult your Regional Sales Office).

Modicon® STB distributed I/O solution

Phaseo® regulated power supplies

Selection of power supplies

Consider the following characteristics when selecting a power supply:

- Required output voltage and current
- Line voltage available in the installation

This may, however, result in several products being selected as suitable. Other selection criteria must therefore be taken into account.

There are 3 possible power supply options for Modicon® STB modules:

- Option 1: One single power supply for the network interface module, sensors, and actuators. Advantages: Simple and low-cost.
- Option 2: Two power supplies: 1 for the network interface module and 1 for the sensors/actuators. Advantage: Separation of the bus and fieldbus.
- Option 3: Three power supplies: 1 for the network interface module, 1 for the sensors, and 1 for the actuators. Advantage: Suitable for applications requiring minimum interference at the inputs. See power supply combination table on page 121.

Quality of the line supply

The Phaseo® range is the ideal solution because it helps to ensure accuracy to 3% of the output voltage, whatever the load current and the input voltage. In addition, the wide input voltage range of Phaseo power supplies allows them to be connected to line supplies within this range, without any adjustment required.

The Phaseo RP family can also be connected to 110 and 220 V --- emergency supplies.

Harmonic pollution (power factor)

The current drawn by a power supply is not sinusoidal. This results in harmonic currents that pollute the line supply. European standard EN 61000-3-2 limits the harmonic currents produced by power supplies. This standard covers devices between 75 W and 1000 W, drawing up to 16 A per phase and connected directly to the public distribution system. Devices connected downstream of a private, low voltage, general transformer are therefore excluded.

Regulated switch mode supplies always produce harmonic currents. A filter circuit (Power Factor Correction or PFC) must therefore be added to comply with standard EN 61000-3-2.

Phaseo ABL 7RP power supplies conform to EN 61000-3-2 and can therefore be connected directly to public distribution systems.

Electromagnetic compatibility

Levels of conducted and radiated emissions are defined in standards EN 55011 and EN 55022.

Products in the Phaseo range have Class B certification and can be used without any restrictions due to their low emissions.

Behavior in the event of short circuits

Phaseo power supplies are equipped with an electronic protection device. This protection device resets itself automatically on correction of the detected fault (around 1 second for ABL 7RE/RP) eliminating the need to take action or change a fuse. In addition, the Phaseo ABL 7RP ranges allow the user to select the reset mode in the event of a detected fault:

- In the "AUTO" position, resetting is automatic
- In the "MANU" position, resetting occurs after elimination of the detected fault and after switching the line supply power off and back on.

This feature allows Phaseo ABL 7RP power supplies to be used in installations where the hazards associated with untimely restarting are significant.

Selection of reset mode

Reset mode is selected using the microswitch on the front panel of the product.

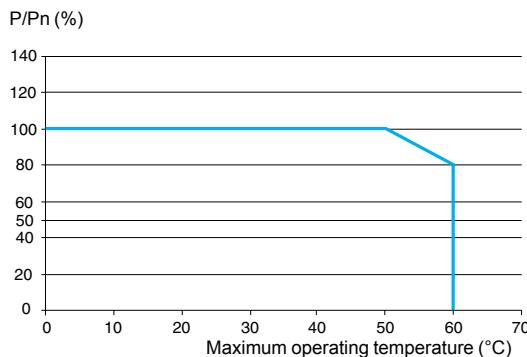

Technical specifications

Modicon® STB

distributed I/O solution

Phaseo® regulated power supplies

**Derating**

The ambient temperature is a determining factor that limits the power an electronic power supply can deliver continuously. If the temperature surrounding the electronic components is too high, their life span will be significantly reduced. Conversely, a power supply can deliver more than its nominal power if the ambient temperature remains largely below the nominal operating temperature.

The nominal ambient temperature for Phaseo® power supplies is 50°C. Above this, derating is necessary up to a maximum temperature of 60°C.

The adjacent graph shows the power P (in relation to the nominal power Pn) that the power supply can deliver continuously as a function of the ambient temperature (on the vertical axis). Derating must be taken into account for extreme operating conditions:

- Intensive operation (output current permanently close to the nominal current, combined with a high ambient temperature)
- Output voltage rising above 24 V (for example, to compensate for line voltage drops)
- Parallel connection to increase the total power

General rules to be complied with**Intensive operation**

See derating on graph at left.

Example for ABL 7RE:

- Without derating, from 0°C to 50°C
- Derating of nominal current by 2% per additional °C, up to 60°C

Rise in output voltage

The nominal power is fixed.

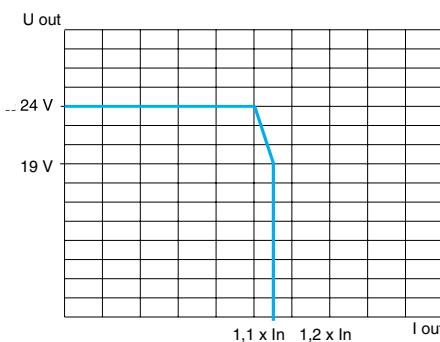

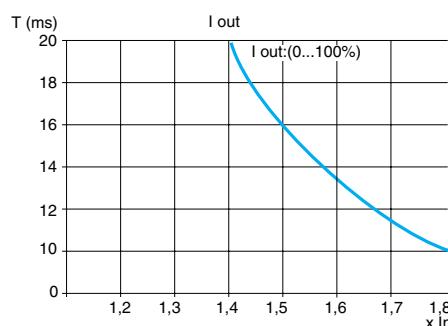

Increasing the output voltage means that the current delivered must be reduced.

Parallel connection to increase the power

The total power is equal to the power sum the power supplies used, but the maximum ambient temperature for operation is 50°C.

To improve heat dissipation, the power supplies must not be in contact with each other.

There must be adequate convection around the products to assist cooling. A clearance of 50 mm must be maintained above and below Phaseo power supplies, as well as a clearance of 15 mm on the sides.

Technical information

Automation products certifications

In some countries, certification of certain electrical components is enforced by law. A standard conformity certificate is then issued by the official organization. Each certified product must carry approval symbols when enforced. Use on board merchant navy vessels generally requires prior approval (= certification) of an electrical device by certain marine classification authorities.

Key	Certification body	Country

Community regulations

European directives

The opening of European markets implies a harmonization of regulations in the various European Union member states.

European Directives are documents used to remove obstacles to the free movement of goods and their application is compulsory in the European Union.

Member states are obliged to transcribe each Directive into their national legislation and, at the same time, to withdraw any conflicting regulations.

The Directives, particularly those of a technical nature, only set objectives, called "general requirements".

The manufacturer must take necessary measures to help ensure that his products conform to the requirements of each Directive relating to his equipment.

As a general rule, the manufacturer affirms that his product conforms to the necessary requirements of the Directive(s) by applying the CE label to his product. The CE marking is applied to Schneider-electric products where relevant.

The significance of CE marking

- The CE marking on a product means that the manufacturer certifies that this product conforms to the relevant European Directives. It is necessary so that a product subject to a Directive(s) can be marketed and freely moved within the European Union.

- The CE marking is intended solely for the national authorities responsible for market regulation.

For electrical equipment, conformity of the product to standards indicates that it is suitable for use.

One or more Directives, as appropriate, may apply to our products, in particular:

- The Low Voltage Directive 2006/95/EC.
- The Electromagnetic Compatibility Directive 89/336/EEC, amended by Directives 2004/108/EC.
- Directive CE ATEX 94/9/EC.

Principle

The 5 V --- required for the logic power supply to the I/O modules is supplied by the following modules:

- **Network interface module (NIM)** placed at the beginning of the primary segment
- **BOS bus extension module** placed at the beginning of each extension segment
- **CPS auxiliary power supply** placed within a segment

The NIM, BOS, and CPS modules use their 24 V --- power supply to deliver a maximum current of 1200 mA at a logic voltage of 5 V --- .

The power consumption per segment must be calculated to help ensure that the current required by the I/O modules does not exceed the current supplied by the different power supply modules. If necessary, add an STB CPS 2111 auxiliary power supply to the segment(s).

Instructions for using the table on the next page

For each segment:

- In the Number column, indicate the required number of I/O modules for each reference.
- In the Total column calculate the total current based on that number.
- In box **1**, enter the grand total of these values (mA).
- The total in box **1** must be less than or equal to 1200 mA, box **2**. If it is greater, add an auxiliary power supply, box **3**.

The Advantys™ STB SPU 1••• configuration and debugging software calculates the power consumption automatically. You can also use an Excel spreadsheet available from your Regional Sales Office or from our web site: www.schneider-electric.us.
